# CS450 Computer Networks

## Lesson 13

### Network Layer – Internet Protocol

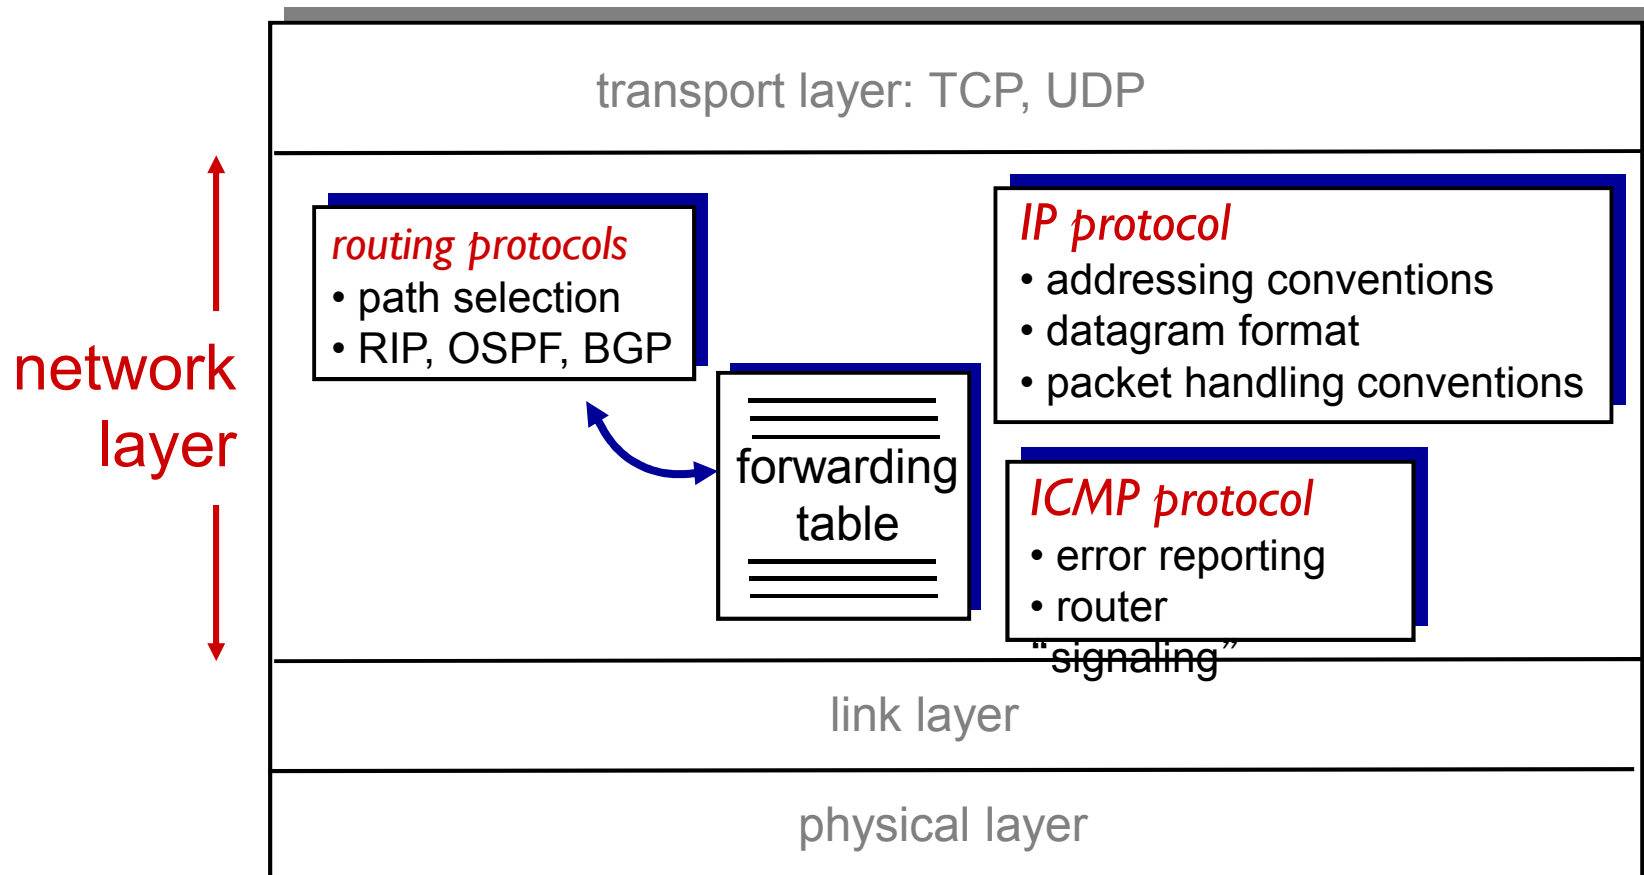

The emergence of three from one –  
knower, known, and process of  
knowing.

# Lesson 13: Network Layer – Internet Protocol

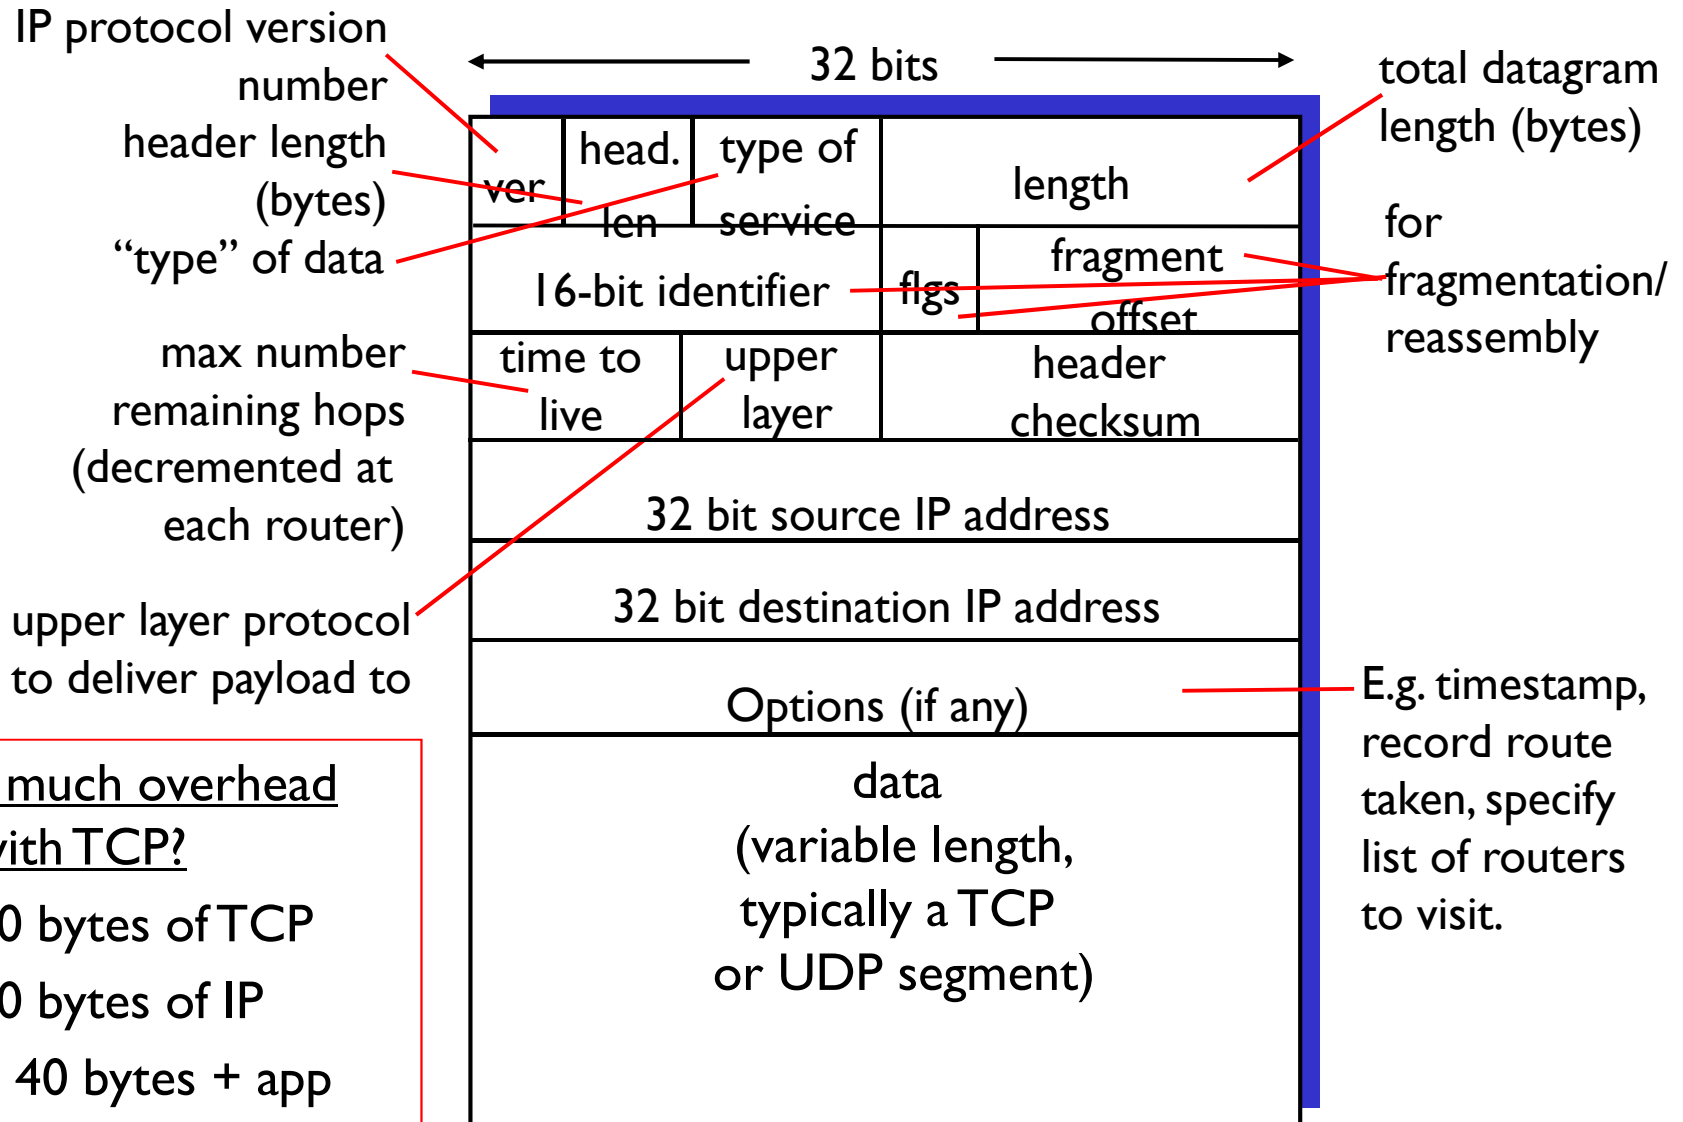

- ❖ Our goal: understand IP, the Internet Protocol
  - Datagram format
  - IPv4 addressing, DHCP, NAT
  - IPv6

# The Internet network layer

host, router network layer functions:

# IP datagram format

## how much overhead with TCP?

- ❖ 20 bytes of TCP
- ❖ 20 bytes of IP
- ❖ = 40 bytes + app layer overhead

# IP Fragmentation & Reassembly

- ❖ network links have MTU (max.transfer size) - largest possible link-level frame.
  - different link types, different MTUs
- ❖ large IP datagram divided (“fragmented”) within net
  - one datagram becomes several datagrams
  - “reassembled” only at final destination
  - IP header bits used to identify, order related fragments

# IP Fragmentation and Reassembly

## Example

- ❖ 4000 byte datagram
- ❖ MTU = 1500 bytes

	length =4000	ID =x	fragflag =0	offset =0	
--	-----------------	----------	----------------	--------------	--

One large datagram becomes  
several smaller datagrams

1480 bytes in  
data field

offset =  
 $1480/8$

	length =1500	ID =x	fragflag =1	offset =0	
	length =1500	ID =x	fragflag =1	offset =185	
	length =1040	ID =x	fragflag =0	offset =370	

# IP Fragmentation Demo

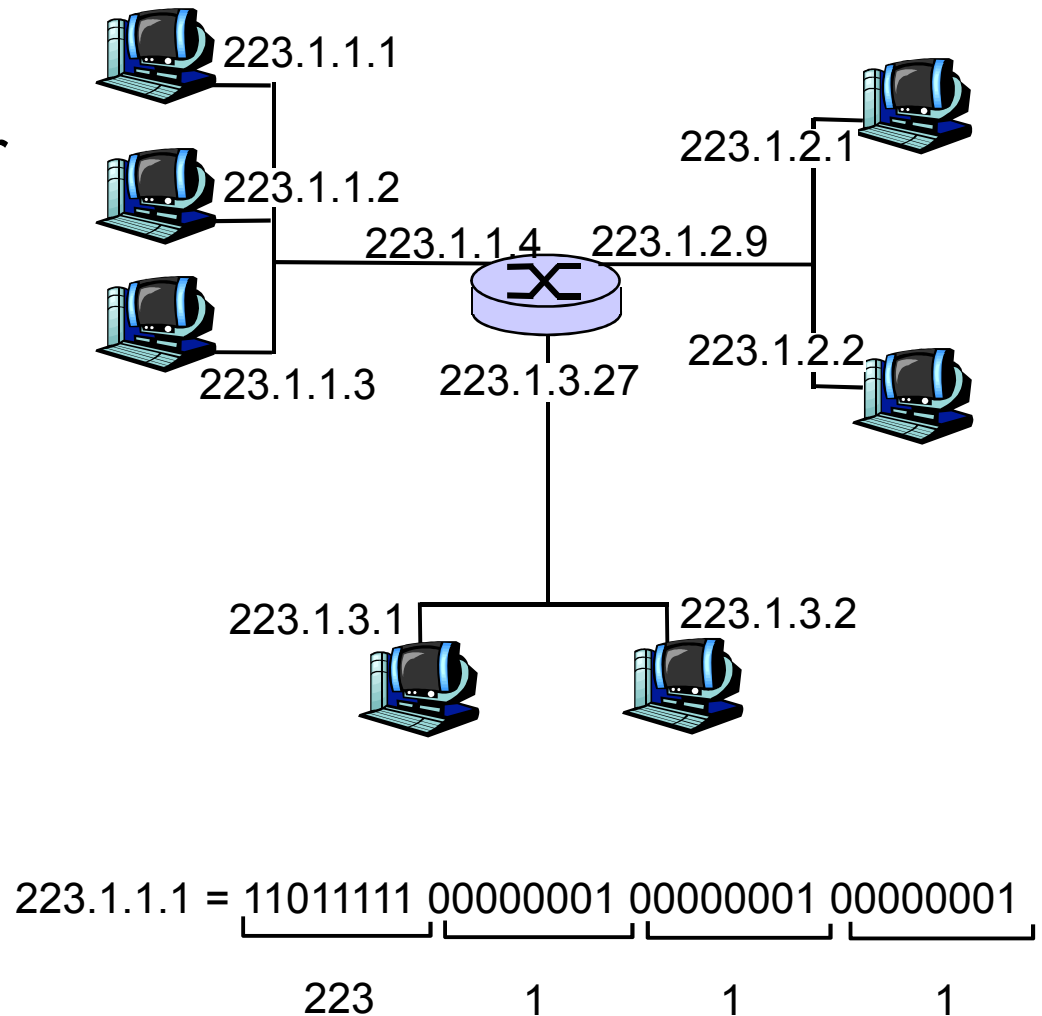

applet showing fragmentation:

[http://media.pearsoncmg.com/aw/aw\\_kurose\\_network\\_2/applets/ip/ipfragmentation.html](http://media.pearsoncmg.com/aw/aw_kurose_network_2/applets/ip/ipfragmentation.html)

# IP Addressing: introduction

- ❖ IP address: 32-bit identifier for host, router *interface*
- ❖ *interface*: connection between host/router and physical link
  - router's typically have multiple interfaces
  - host typically has one interface
  - IP addresses associated with each interface

# Subnets

## ❖ IP address:

- subnet part (high order bits)
- host part (low order bits)

## ❖ *What's a subnet ?*

- device interfaces with same subnet part of IP address
- can physically reach each other **without intervening router**

network consisting of 3 subnets

# Subnets

## Recipe

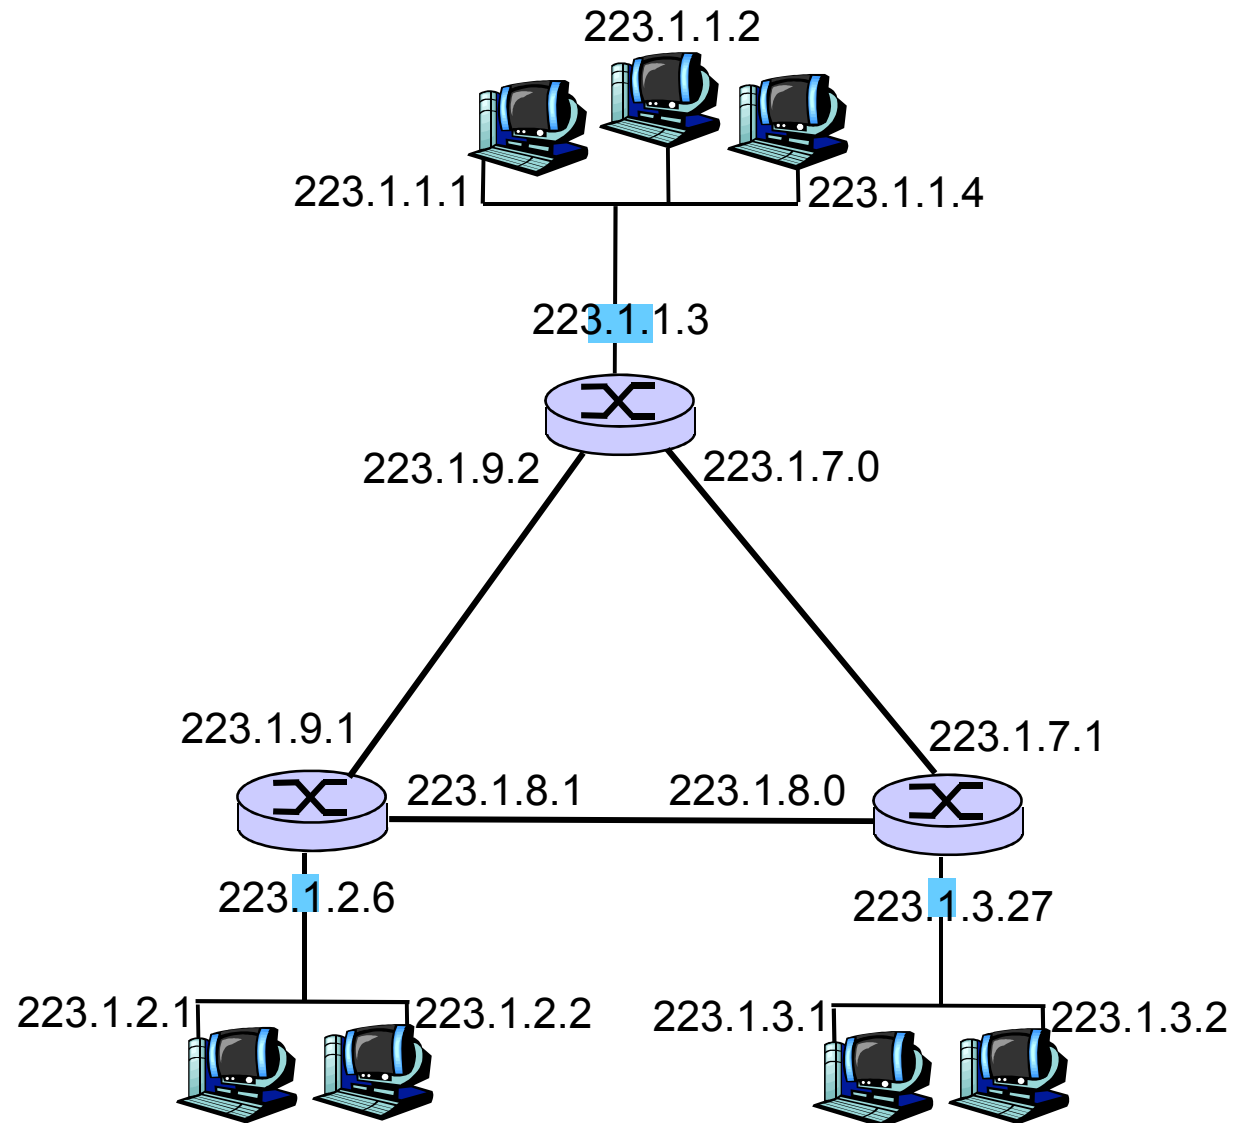

- ❖ to determine the subnets, detach each interface from its host or router, creating islands of isolated networks
- ❖ each isolated network is called a **subnet**.

Subnet mask: /24

# Subnets

How many?

# Subnets

How many? 6

# IP addressing: CIDR

## CIDR: Classless InterDomain Routing

- subnet portion of address of arbitrary length
- address format: **a.b.c.d/x**, where x is # bits in subnet portion of address

# IP addresses: how to get one?

Q: How does a *host* get IP address?

- ❖ hard-coded by system admin in a file
  - Windows: control-panel->network->configuration->tcp/ip->properties
  - UNIX: /etc/rc.config
- ❖ **DHCP**: **D**ynamic **H**ost **C**onfiguration **P**rotocol: dynamically get address from a server
  - “plug-and-play”

# DHCP: Dynamic Host Configuration Protocol

Goal: allow host to *dynamically* obtain its IP address from network server when it joins network

Can renew its lease on address in use

Allows reuse of addresses (only hold address while connected and “on”)

Support for mobile users who want to join network (more shortly)

DHCP overview:

- host broadcasts “DHCP discover” msg [optional]
- DHCP server responds with “DHCP offer” msg [optional]
- host requests IP address: “DHCP request” msg
- DHCP server sends address: “DHCP ack” msg

# DHCP client-server scenario

# DHCP client-server scenario

DHCP server: 223.1.2.5

## DHCP discover

src : 0.0.0.0, 68  
dest.: 255.255.255.255, 67  
yiaddr: 0.0.0.0  
transaction ID: 654

arriving  
client

## DHCP offer

src: 223.1.2.5, 67  
dest: 255.255.255.255, 68  
yiaddr: 223.1.2.4  
transaction ID: 654  
Lifetime: 3600 secs

## DHCP request

src: 0.0.0.0, 68  
dest.: 255.255.255.255, 67  
yiaddr: 223.1.2.4  
transaction ID: 655  
Lifetime: 3600 secs

## DHCP ACK

src: 223.1.2.5, 67  
dest: 255.255.255.255, 68  
yiaddr: 223.1.2.4  
transaction ID: 655  
Lifetime: 3600 secs

time

# DHCP: more than IP address

DHCP can return more than just allocated IP address on subnet:

- address of first-hop router for client
- name and IP address of DNS sever
- network mask (indicating network versus host portion of address)

# DHCP: example

- ❖ connecting laptop needs its IP address, addr of first-hop router, addr of DNS server: use DHCP
- ❖ DHCP request encapsulated in UDP, encapsulated in IP, encapsulated in 802.1 Ethernet
- ❖ Ethernet frame broadcast (dest: FFFFFFFFFFFFFFFF) on LAN, received at router running DHCP server
- ❖ Ethernet demuxed to IP demuxed, UDP demuxed to DHCP

# DHCP: example

- ❖ DHCP server formulates DHCP ACK containing client's IP address, IP address of first-hop router for client, name & IP address of DNS server
- ❖ encapsulation of DHCP server, frame forwarded to client, demuxing up to DHCP at client
- ❖ client now knows its IP address, name and IP address of DNS server, IP address of its first-hop router

# DHCP: Wireshark output (home LAN)

Message type: **Boot Request (1)**  
Hardware type: Ethernet  
Hardware address length: 6  
Hops: 0  
**Transaction ID: 0x6b3a11b7**  
Seconds elapsed: 0  
Bootp flags: 0x0000 (Unicast)  
Client IP address: 0.0.0.0 (0.0.0.0)  
Your (client) IP address: 0.0.0.0 (0.0.0.0)  
Next server IP address: 0.0.0.0 (0.0.0.0)  
Relay agent IP address: 0.0.0.0 (0.0.0.0)  
**Client MAC address: Wistron\_23:68:8a (00:16:d3:23:68:8a)**  
Server host name not given  
Boot file name not given  
Magic cookie: (OK)  
Option: (t=53,l=1) **DHCP Message Type = DHCP Request**  
Option: (61) Client identifier

    IP Address: 68.87.64.146  
**Option: (t=15,l=20) Domain Name = "hsd1.ma.comcast.net."**

reply

# IP addresses: how to get one?

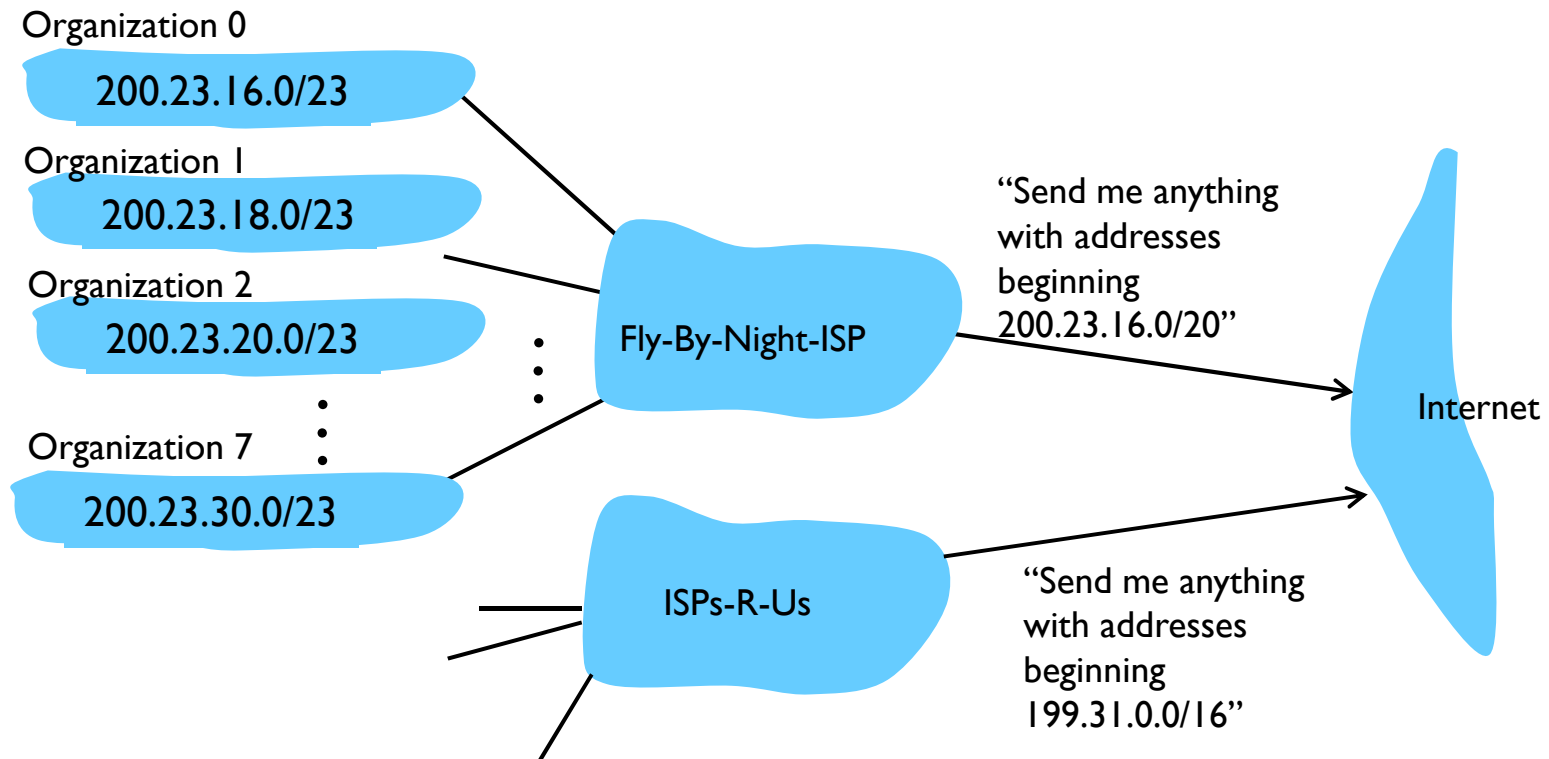

Q: How does *network* get subnet part of IP addr?

A: gets allocated portion of its provider ISP's address space

ISP's block	<u>11001000 00010111 00010000</u> 00000000	200.23.16.0/20
Organization 0	<u>11001000 00010111 00010000</u> 00000000	200.23.16.0/23
Organization 1	<u>11001000 00010111 00010010</u> 00000000	200.23.18.0/23
Organization 2	<u>11001000 00010111 00010100</u> 00000000	200.23.20.0/23
...	.....	....
Organization 7	<u>11001000 00010111 00011110</u> 00000000	200.23.30.0/23

# Hierarchical addressing: route aggregation

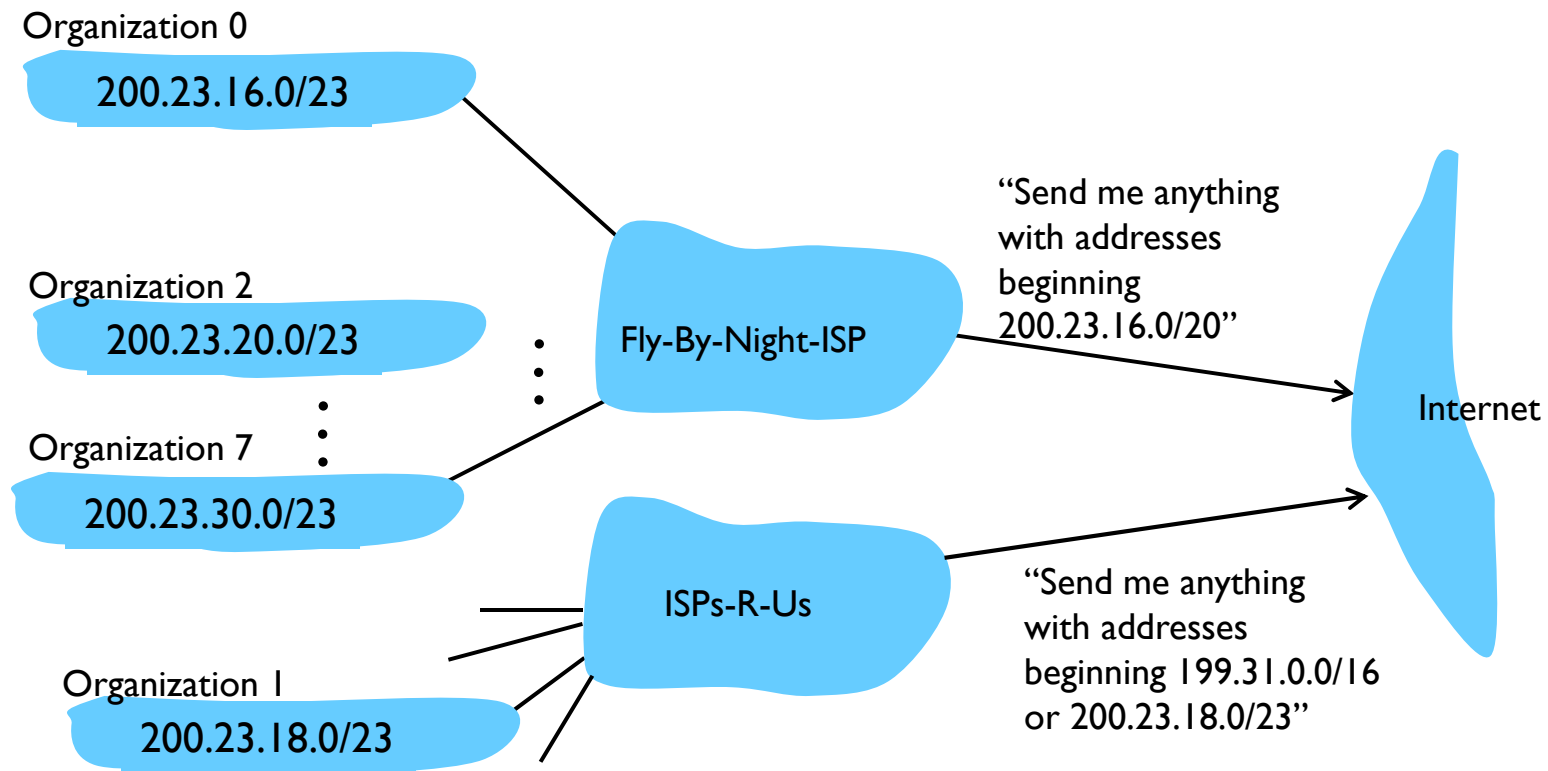

Hierarchical addressing allows efficient advertisement of routing information:

# Hierarchical addressing: more specific routes

ISPs-R-Us has a more specific route to Organization 1

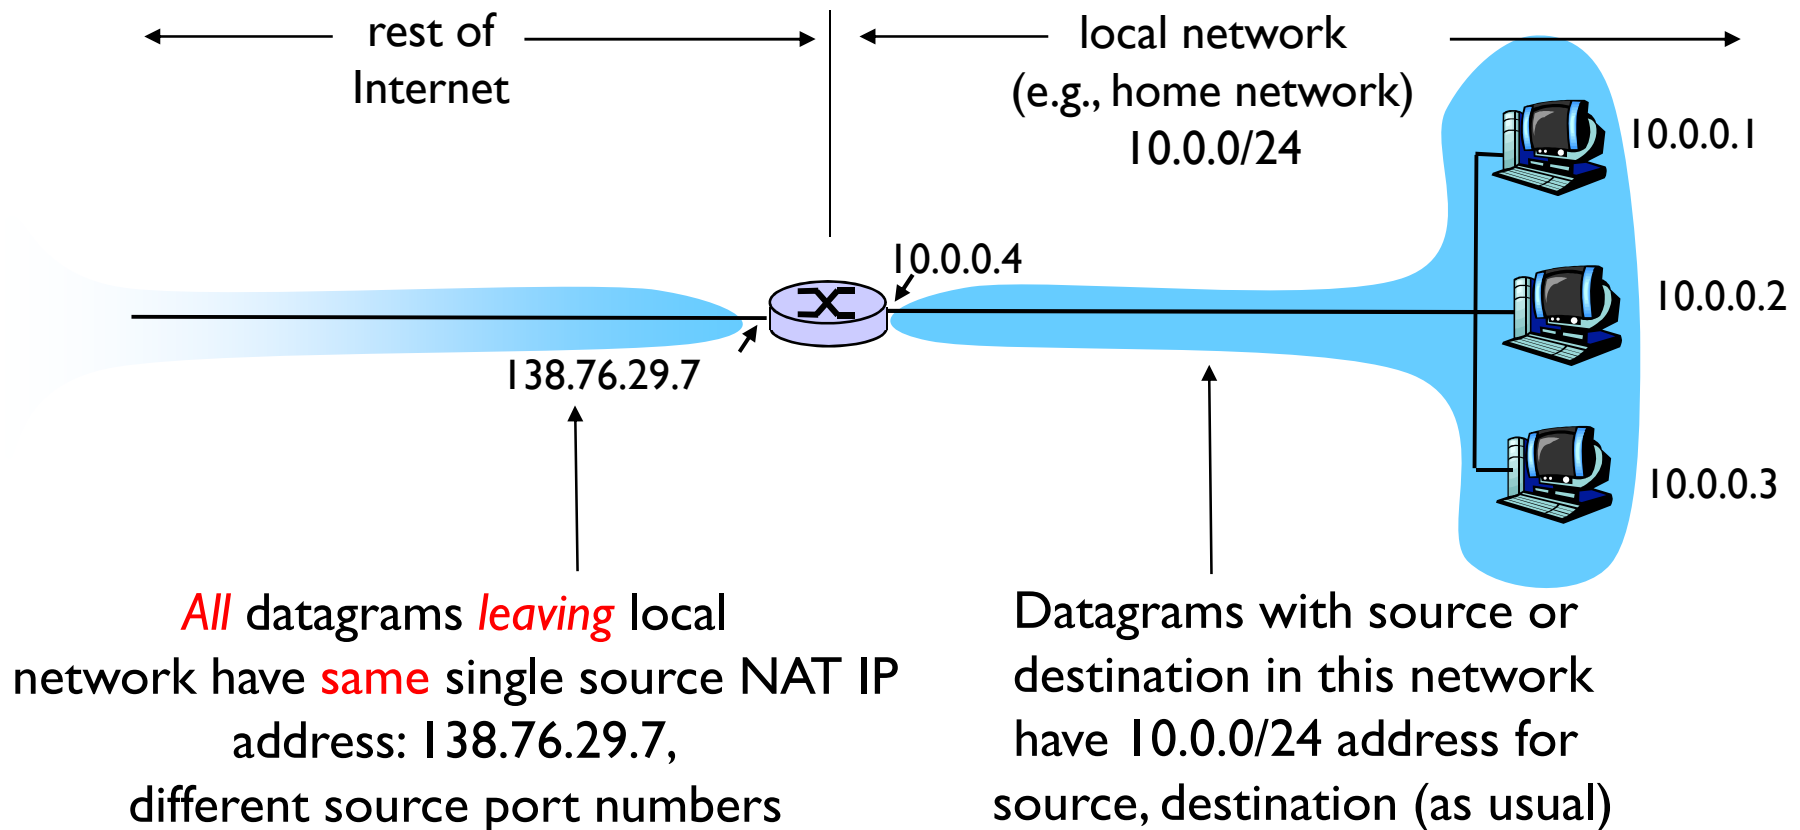

## IP addressing: the last word...

Q: How does an ISP get block of addresses?

A: **ICANN**: Internet **C**orporation for **A**ssigned  
**N**ames and **N**umbers

- allocates addresses
- manages DNS
- assigns domain names, resolves disputes

# NAT: Network Address Translation

# NAT: Network Address Translation

- ❖ **Motivation:** Why are NAT's so useful?

# NAT: Network Address Translation

- ❖ **Motivation:** local network uses just one IP address as far as outside world is concerned:
  1. range of addresses not needed from ISP: just one IP address for all devices
  2. can change addresses of devices in local network without notifying outside world
  3. can change ISP without changing addresses of devices in local network
  4. devices inside local net not explicitly addressable, visible by outside world (a security plus).

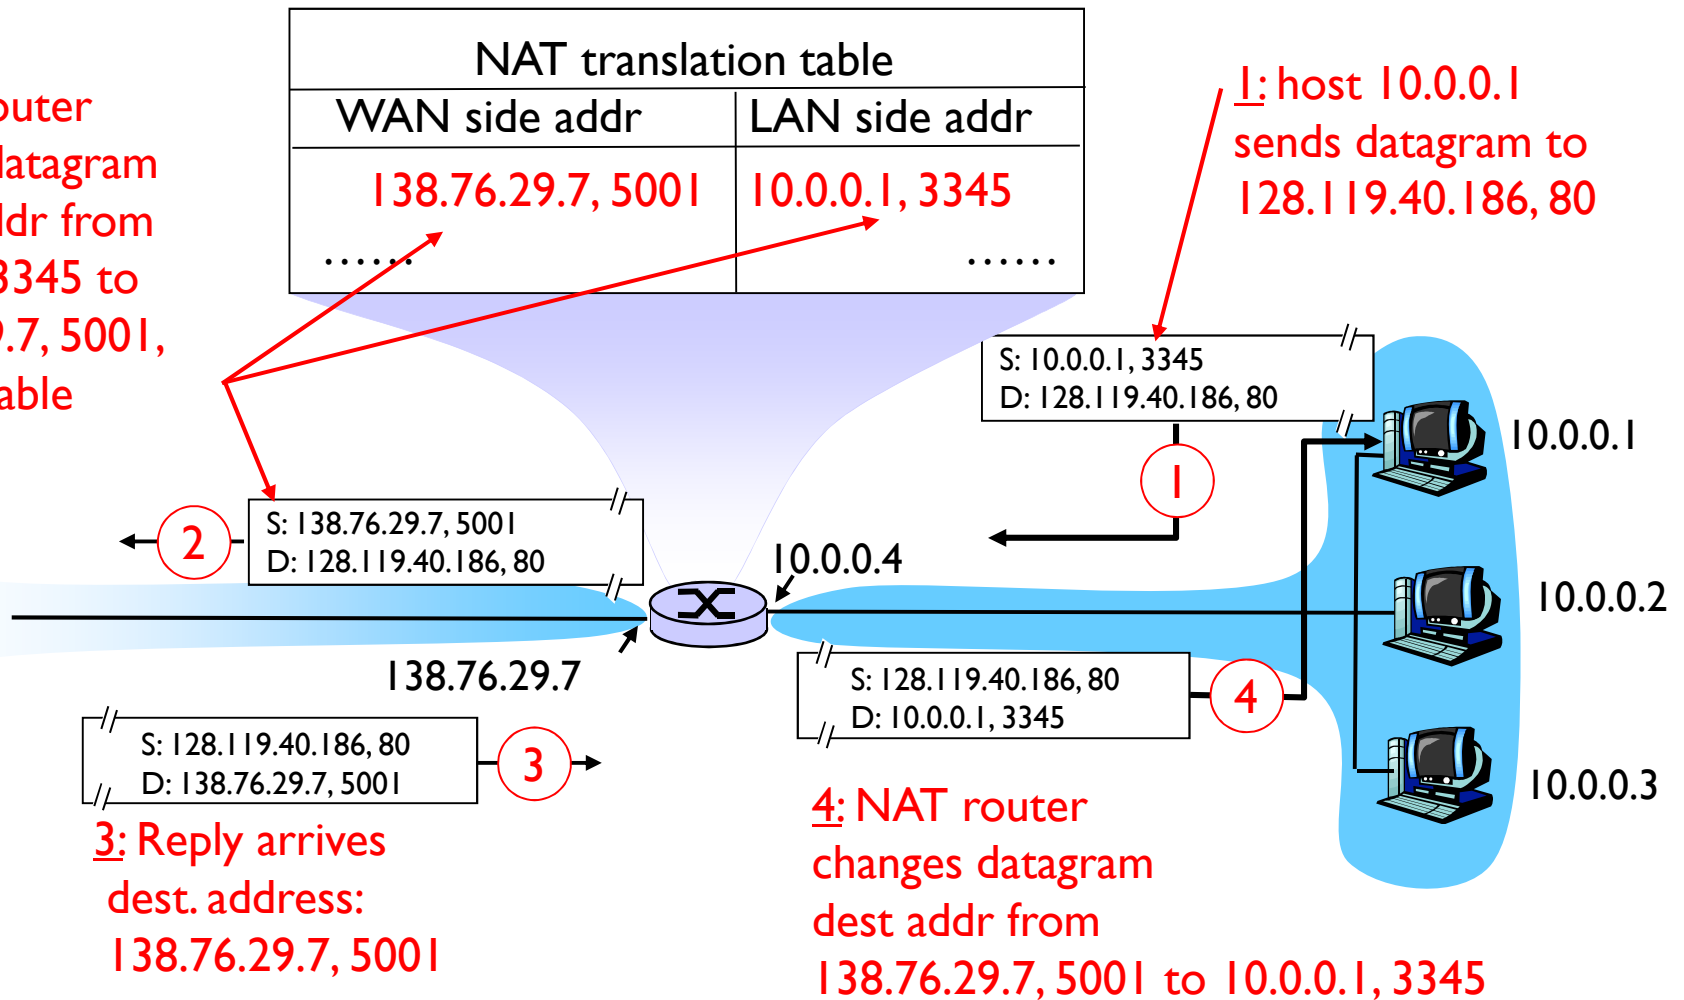

# NAT: Network Address Translation

**Implementation:** NAT router must:

- *outgoing datagrams: replace* (source IP address, port #) of every outgoing datagram to (NAT IP address, new port #)  
... remote clients/servers will respond using (NAT IP address, new port #) as destination addr.
- *remember (in NAT translation table)* every (source IP address, port #) to (NAT IP address, new port #) translation pair
- *incoming datagrams: replace* (NAT IP address, new port #) in dest fields of every incoming datagram with corresponding (source IP address, port #) stored in NAT table

# NAT: Network Address Translation

2: NAT router changes datagram source addr from 10.0.0.1, 3345 to 138.76.29.7, 5001, updates table

# NAT: Network Address Translation

- ❖ 16-bit port-number field:
  - 60,000 simultaneous connections with a single LAN-side address!
- ❖ NAT is controversial:
  - **Why would anyone have a problem with NATs??**

# NAT: Network Address Translation

## ❖ NAT is controversial:

1. routers should only process up to layer 3
2. violates end-to-end argument

NAT possibility must be taken into account by app designers,  
e.g., P2P applications

3. address shortage should instead be solved by IPv6

# NAT traversal problem

- ❖ client wants to connect to server with address 10.0.0.1
  - server address 10.0.0.1 local to LAN (client can't use it as destination addr)
  - only one externally visible NATed address: 138.76.29.7
- **Can you think of a good solution?**

# NAT traversal problem

- ❖ client wants to connect to server with address 10.0.0.1
  - server address 10.0.0.1 local to LAN (client can't use it as destination addr)
  - only one externally visible NATed address: 138.76.29.7
- ❖ solution 1: **statically configure** NAT to forward incoming connection requests at given port to server
  - e.g., (138.76.29.7, port 2500) always forwarded to 10.0.0.1 port 25000

# NAT traversal problem

- ❖ solution 2: Universal Plug and Play (UPnP) **Internet Gateway Device (IGD) Protocol**. Allows NATed host to:

- ❖ learn public IP address (138.76.29.7)
- ❖ add/remove port mappings (with lease times)

i.e., **automate** static NAT port map configuration

# NAT traversal problem

- ❖ solution 3: **relaying** (used in Skype)
  - NATed client establishes connection to relay
  - External client connects to relay
  - relay bridges packets between to connections

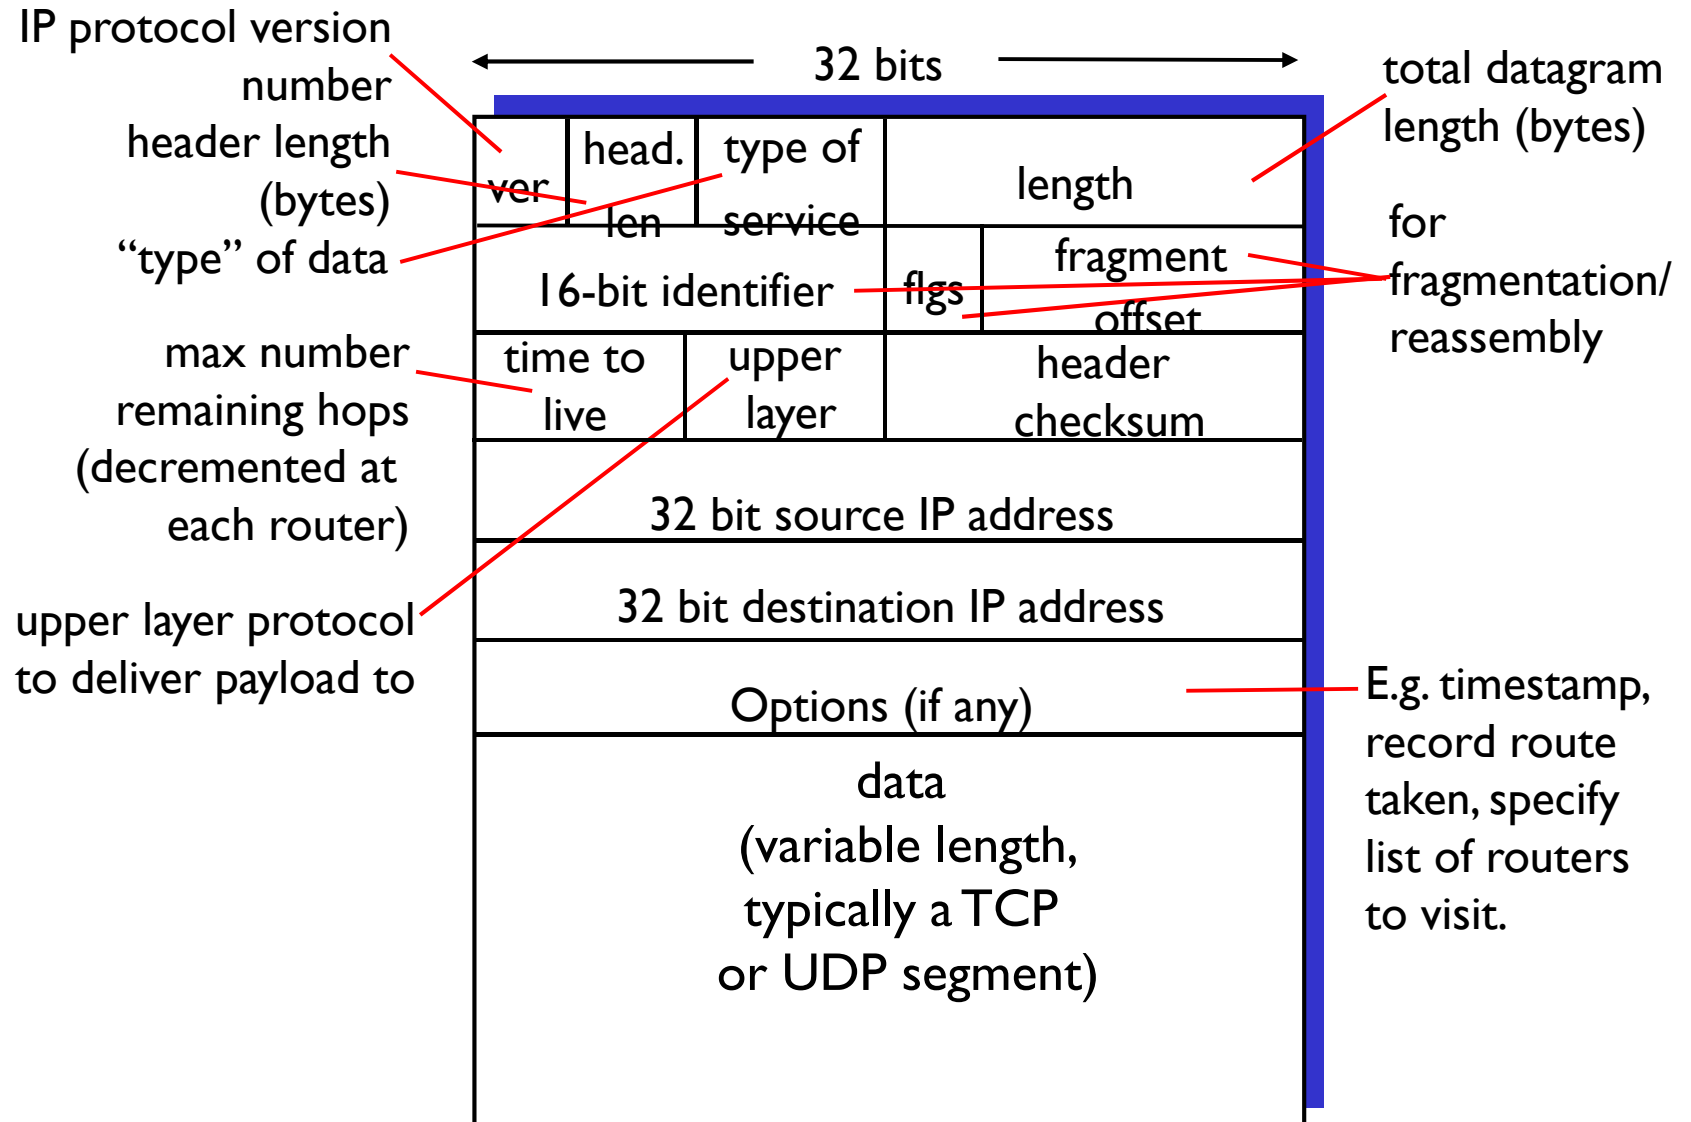

# IPv6

- ❖ **Initial motivation:** 32-bit address space is completely allocated.
- ❖ Additional motivation:
  - Modify header format to help speed processing/forwarding

**Can you identify IPv4 datagram fields that are candidates for change to speed up processing?**

# IP datagram format

# IPv6

- ❖ **Initial motivation:** 32-bit address space is completely allocated.
- ❖ Additional motivation:
  - header format helps speed processing/forwarding
  - header changes to facilitate QoS

## **IPv6 datagram format:**

- **fixed-length 40 byte header**
- **no fragmentation allowed**

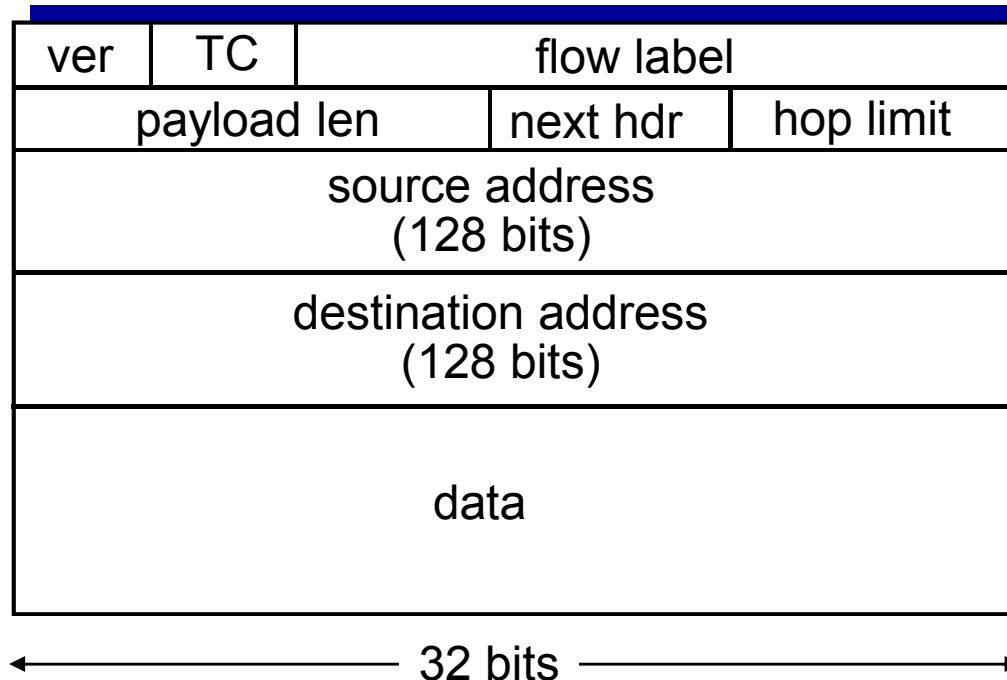

# IPv6 datagram format

*Traffic class:* type of service/priority

*flow label:* identify datagrams in same “flow.”  
(concept of “flow” not well defined).

*next header:* identify upper layer protocol for data

## Other Changes from IPv4

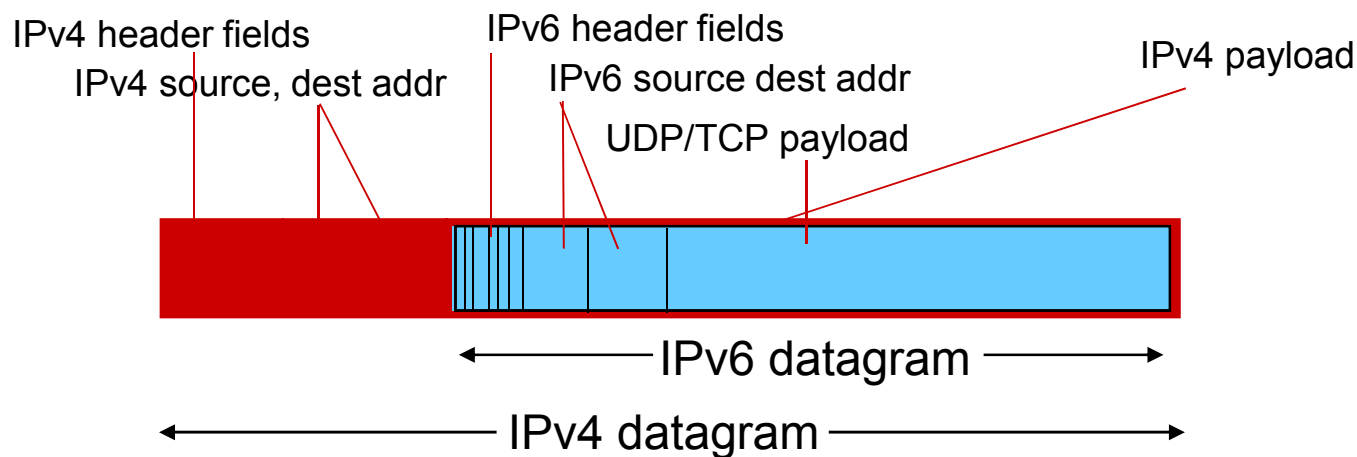

- ❖ *Checksum*: removed entirely to reduce processing time at each hop
- ❖ *Options*: allowed, but outside of header, indicated by “Next Header” field
- ❖ *ICMPv6*: new version of ICMP
  - additional message types, e.g. “Packet Too Big”
  - multicast group management functions

# Transition From IPv4 To IPv6

- ❖ Not all routers can be upgraded simultaneous
  - no time when we can shut down the internet for a few hours.....
  - **How will the network operate with mixed IPv4 and IPv6 routers? Can you think of a human protocol analogy?**

# Transition from IPv4 to IPv6

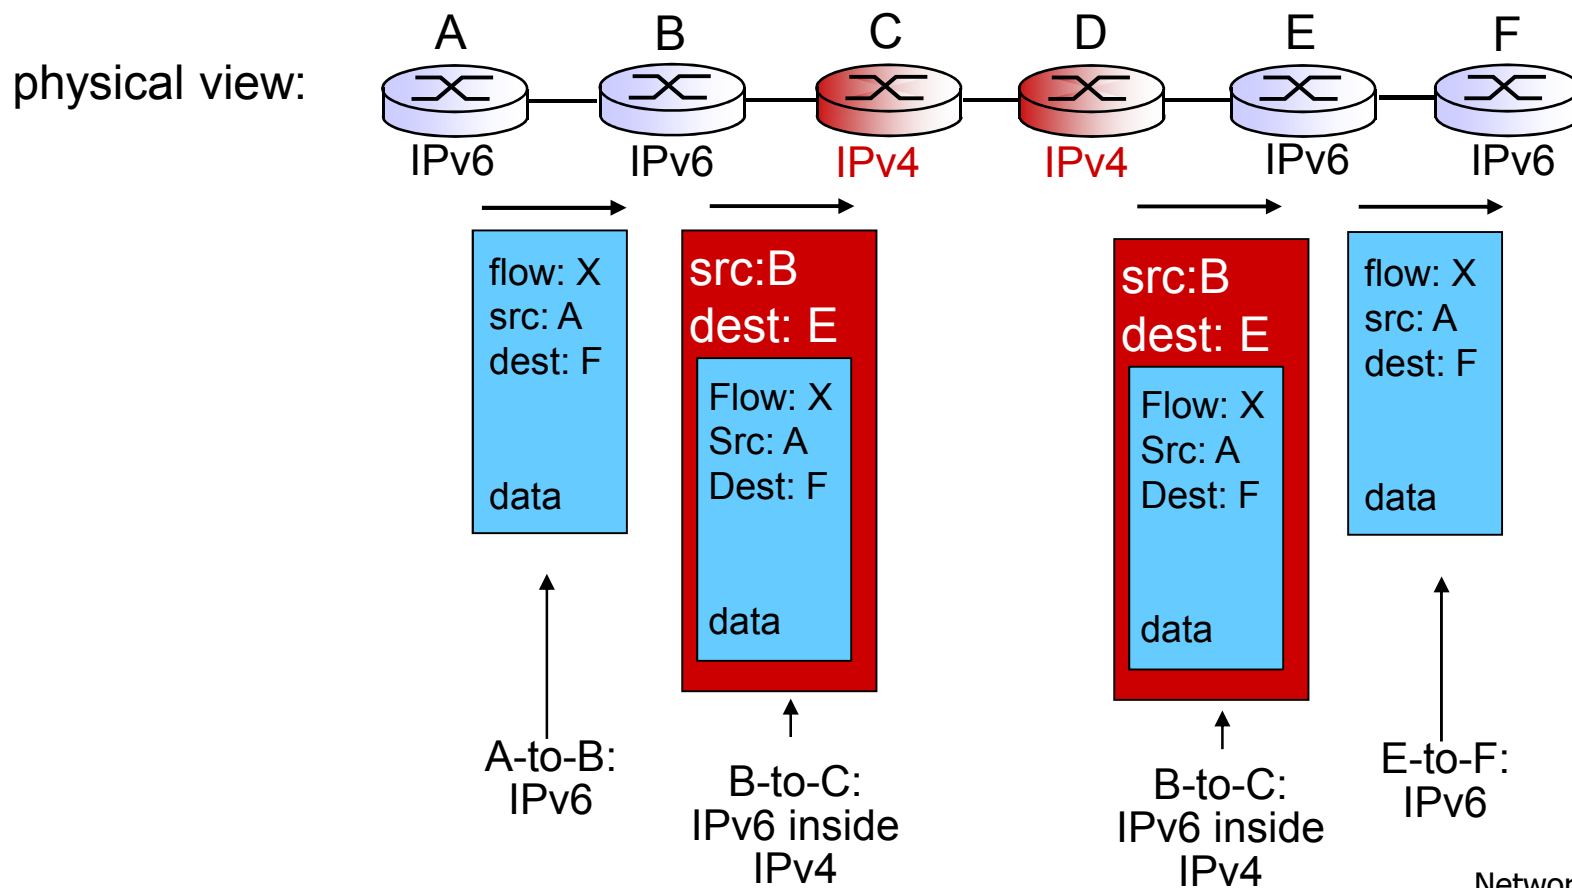

- ❖ not all routers can be upgraded simultaneously
- ❖ **tunneling: IPv6 datagram carried as payload in IPv4 datagram among IPv4 routers**

# Tunneling

# Tunneling

# Lesson 13: Network Layer – Internet Protocol

- ❖ Summary: the Internet Protocol main parts -
  - Datagram format
  - IPv4 addressing and network topology
  - DHCP
  - NAT
  - IPv6 and interconnect with IPv4
