# CS450 Computer Networks

## Lesson 8

### Transport Layer – Overview

The organizing power of pure  
consciousness

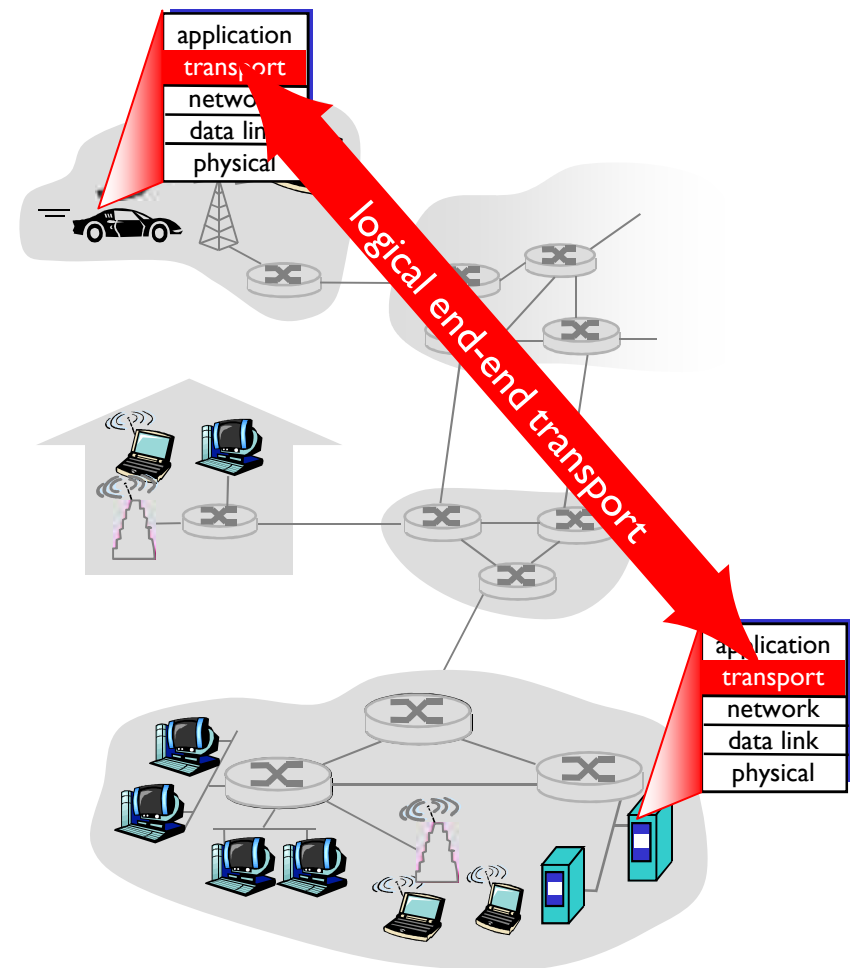

# Lesson 8: Transport Layer – Services – Introduction

## Our goals:

- ❖ Understand transport layer services
- ❖ Understand transport layer multiplexing/demultiplexing
- ❖ Review and add to our knowledge of UDP – the simple transport layer protocol in the Internet

# Transport services and protocols

- ❖ provide *logical communication* between app processes running on different hosts
- ❖ transport protocols run in end systems
  - send side: breaks app messages into **segments**, passes to network layer
  - rcv side: reassembles segments into messages, passes to app layer
- ❖ more than one transport protocol available to apps
  - Internet: TCP and UDP

# Transport vs. network layer

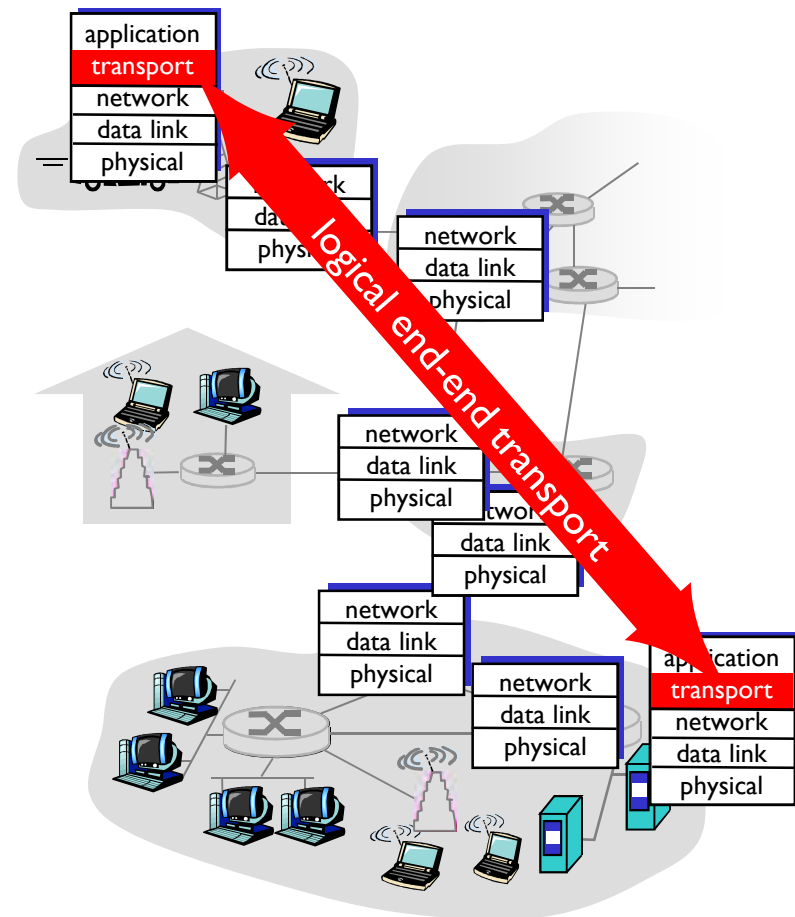

- ❖ *network layer*: logical communication between hosts
- ❖ *transport layer*: logical communication between processes
  - relies on, enhances, network layer services

## classroom analogy:

- ❖ 4 students (group A) sending messages to 4 students (group B)
- ❖ processes = students
- ❖ app messages = messages in envelopes
- ❖ hosts = group
- ❖ transport protocol = group coordinators of A and B who mux/demux for fellow group members
- ❖ network-layer protocol = papers in a delivery bag

# Internet transport-layer protocols

- ❖ reliable, in-order delivery (TCP)
  - congestion control
  - flow control
  - connection setup
- ❖ unreliable, unordered delivery: UDP
  - no-frills extension of “best-effort” IP
- ❖ services not available:
  - delay guarantees
  - bandwidth guarantees

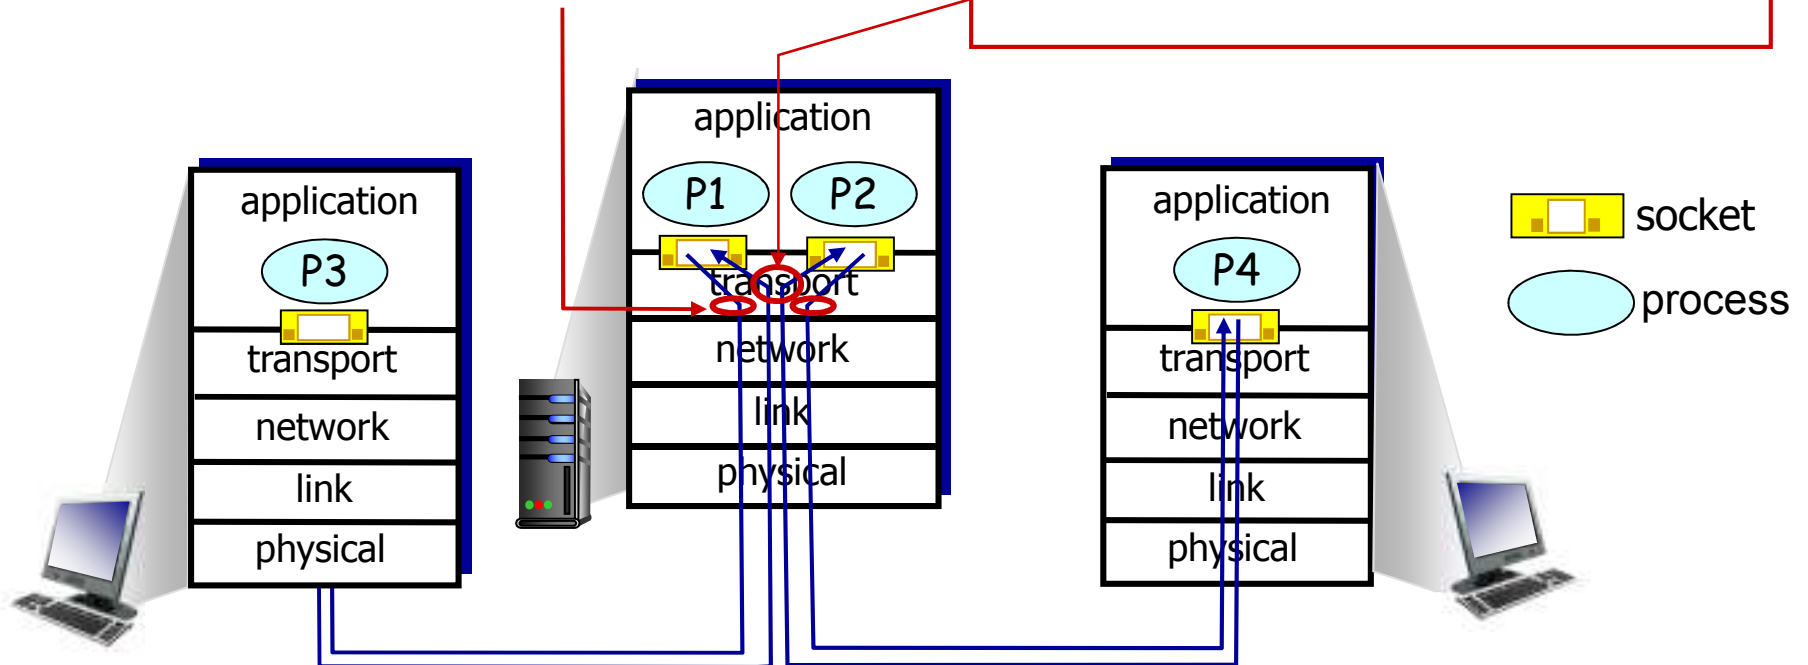

# Multiplexing/demultiplexing

## *multiplexing at sender:*

handle data from multiple sockets, add transport header (later used for demultiplexing)

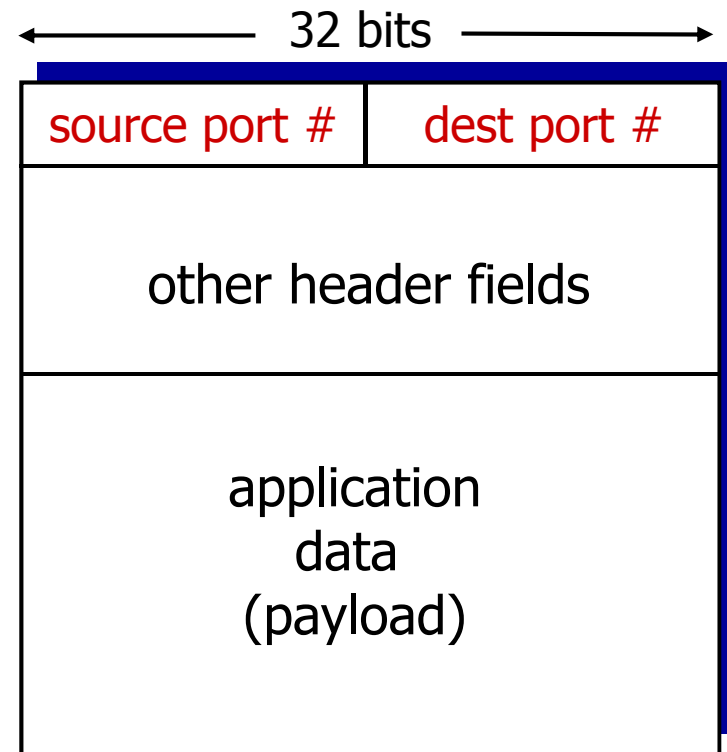

## *demultiplexing at receiver:*

use header info to deliver received segments to correct socket

# How demultiplexing works

- ❖ host receives IP datagrams
  - each datagram has source IP address, destination IP address
  - each datagram carries one transport-layer segment
  - each segment has source, destination port number
- ❖ host uses *IP addresses & port numbers* to direct segment to appropriate socket

TCP/UDP segment format

# Connectionless demultiplexing

- ❖ *recall*: create sockets with host-local port numbers:

```
DatagramSocket mySocket1 = new  
    DatagramSocket(12534);
```

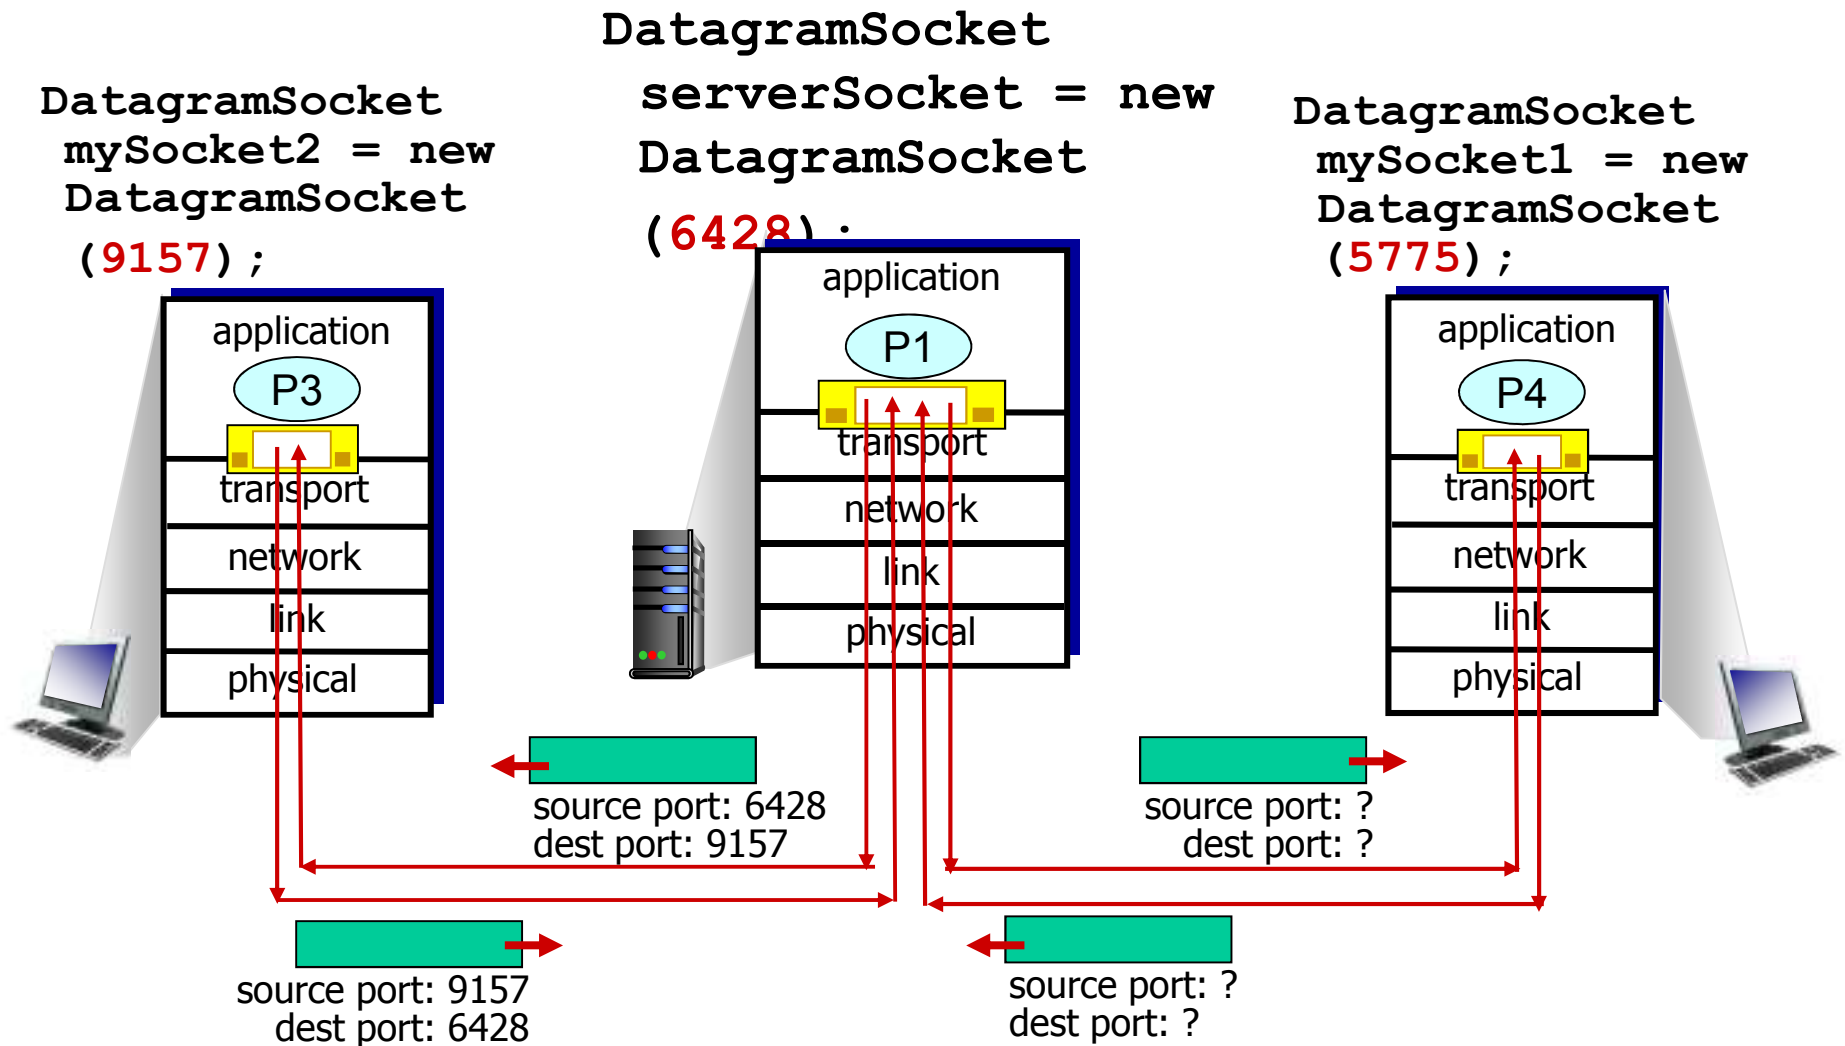

```
DatagramSocket mySocket2 = new  
    DatagramSocket(12535);
```

- ❖ *recall*: when creating datagram to send into UDP socket, must specify

(dest IP address, dest port number)

- ❖ when host receives UDP segment:
  - checks destination port number in segment
  - directs UDP segment to socket with that port number
- ❖ IP datagrams with different source IP addresses and/or source port numbers directed to same socket

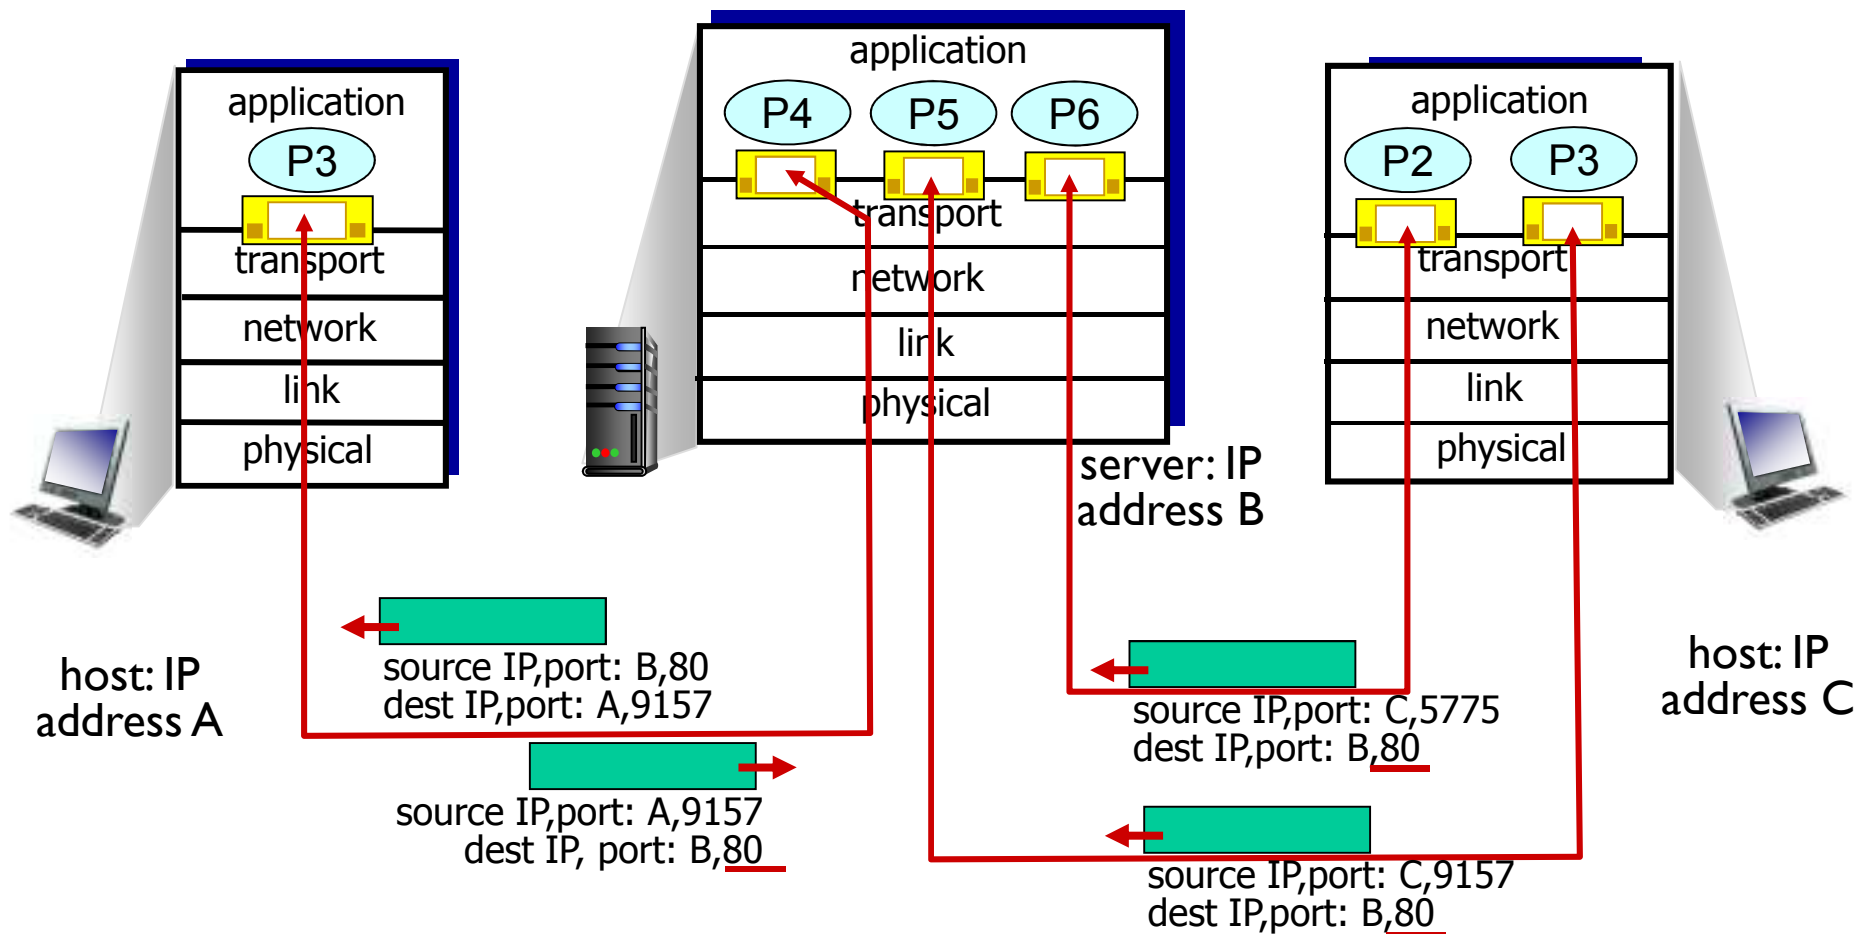

# Connectionless demux: example

# Connection-oriented demux

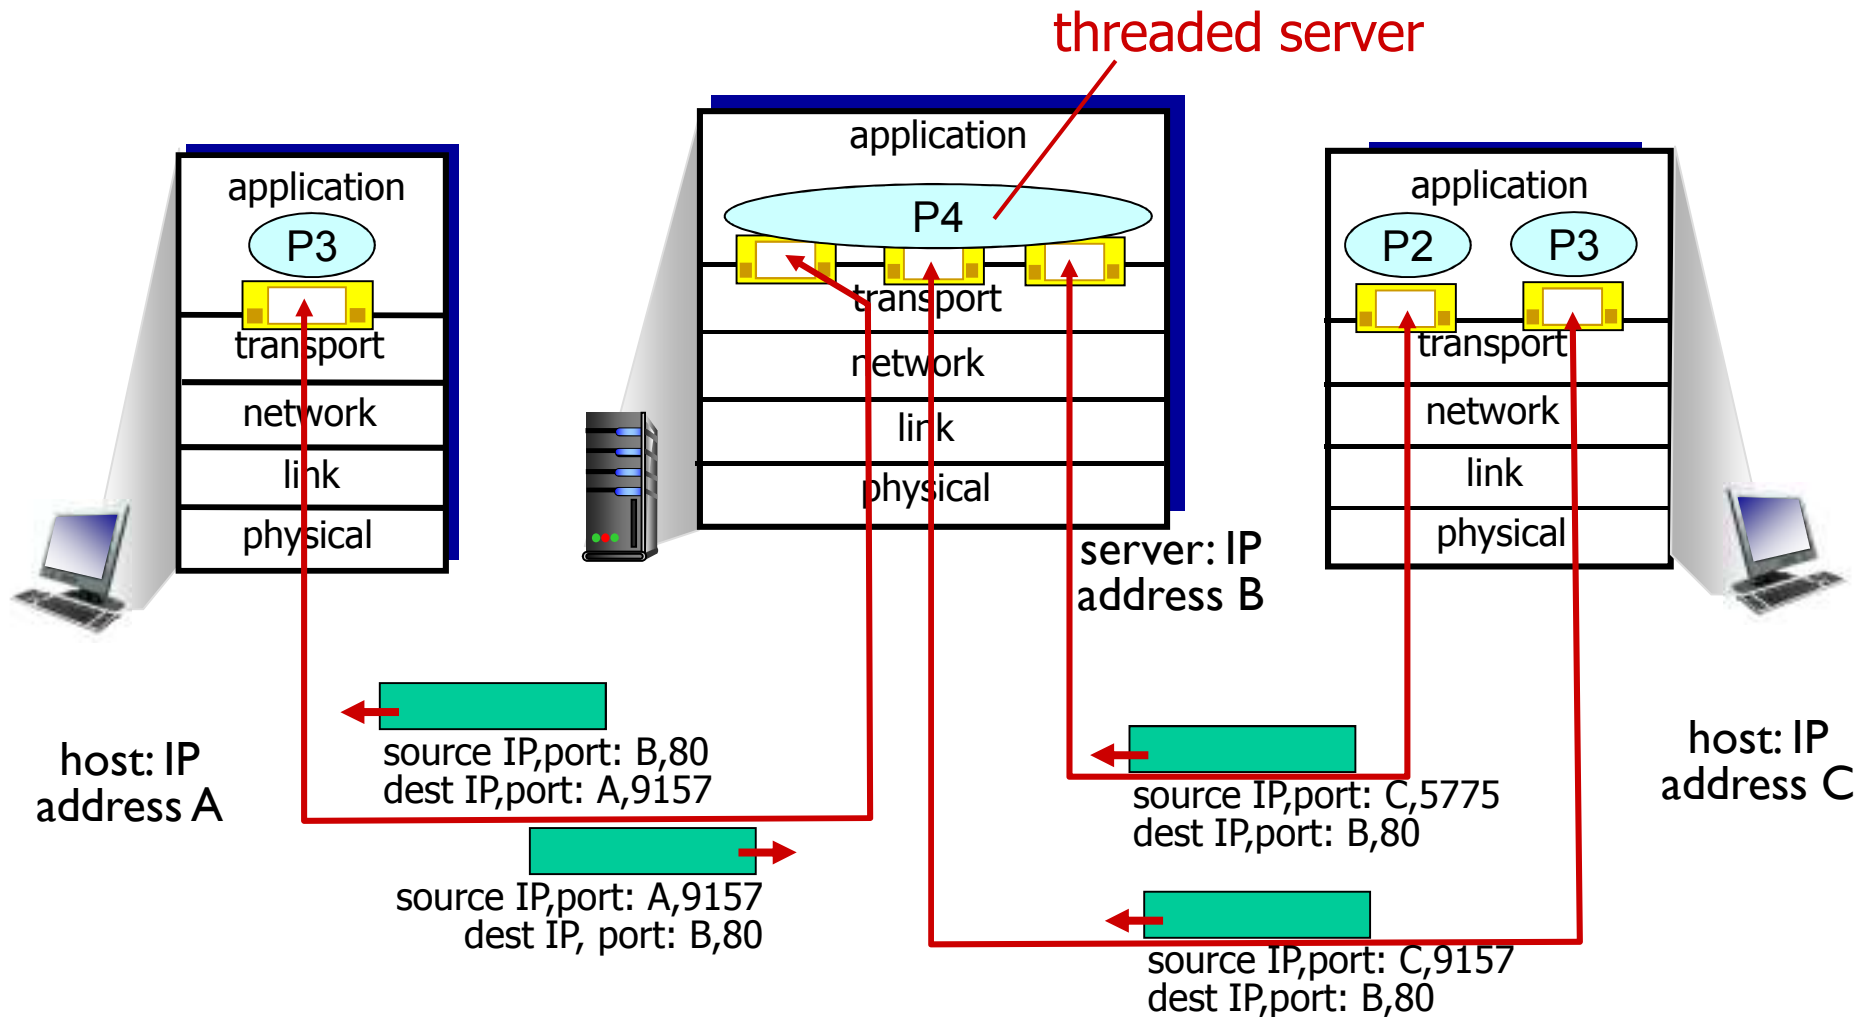

- ❖ TCP socket identified by 4-tuple:
  - source IP address
  - source port number
  - dest IP address
  - dest port number
- ❖ demux: receiver uses all four values to direct segment to appropriate socket
- ❖ server host may support many simultaneous TCP sockets:
  - each socket identified by its own 4-tuple
- ❖ web servers have different sockets for each connecting client
  - non-persistent HTTP will have different socket for each request

# Connection-oriented demux: example

three segments, all destined to IP address: B,  
dest port: 80 are demultiplexed to *different* sockets

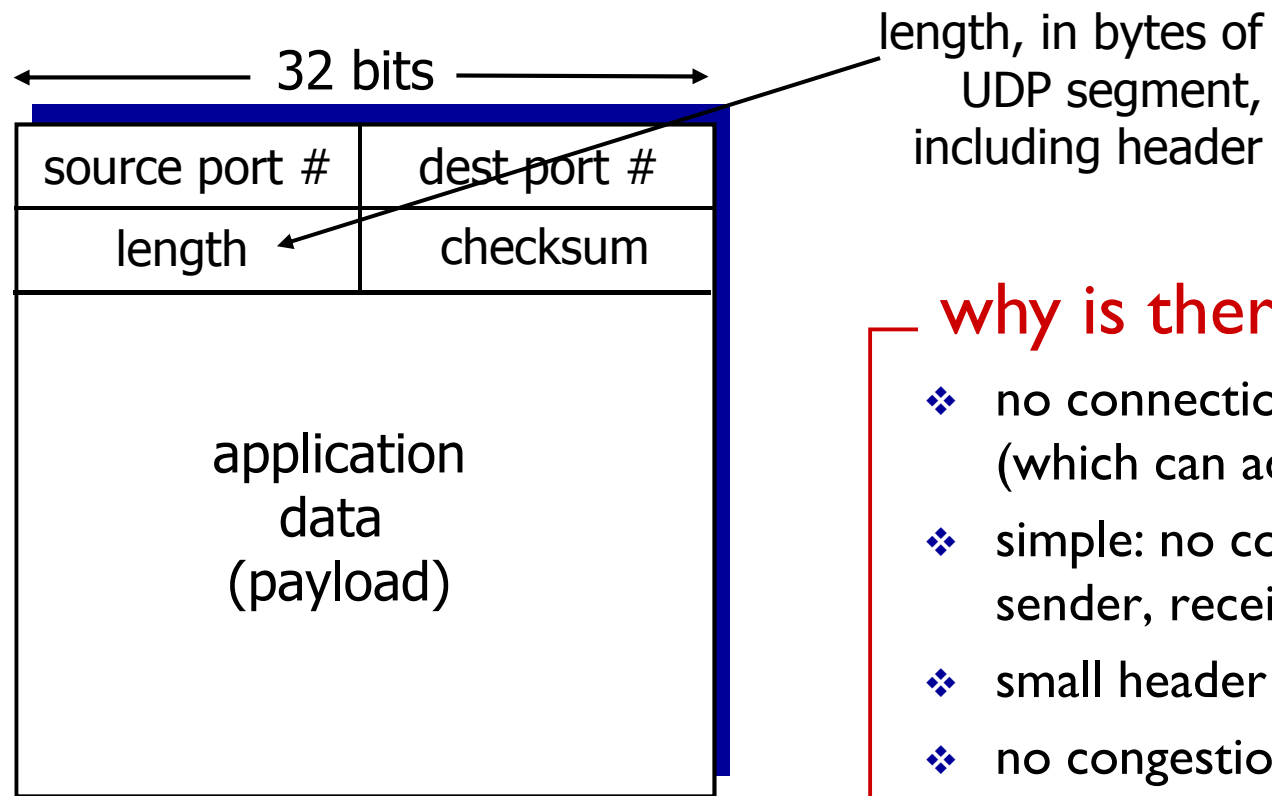

# Connection-oriented demux: example

# UDP: User Datagram Protocol [RFC 768]

- ❖ “no frills,” “bare bones”  
Internet transport protocol
- ❖ “best effort” service, UDP segments may be:
  - lost
  - delivered out-of-order to app
- ❖ *connectionless*:
  - no handshaking between UDP sender, receiver
  - each UDP segment handled independently of others
- ❖ UDP use:
  - streaming multimedia apps (loss tolerant, rate sensitive)
  - DNS
  - SNMP
- ❖ reliable transfer over UDP:
  - add reliability at application layer
  - application-specific error recovery!

# UDP: segment header

UDP segment format

## why is there a UDP?

- ❖ no connection establishment (which can add delay)
- ❖ simple: no connection state at sender, receiver
- ❖ small header size
- ❖ no congestion control: UDP can blast away as fast as desired

# UDP checksum

Goal: detect “errors” (e.g., flipped bits) in transmitted segment

## Sender:

- ❖ treat segment contents as sequence of 16-bit integers
- ❖ checksum: addition (1's complement sum) of segment contents
- ❖ sender puts checksum value into UDP checksum field

## Receiver:

- ❖ compute checksum of received segment
- ❖ check if computed checksum equals checksum field value:
  - NO - error detected
  - YES - no error detected. *But maybe errors nonetheless?*  
More later ....

# Internet checksum: example

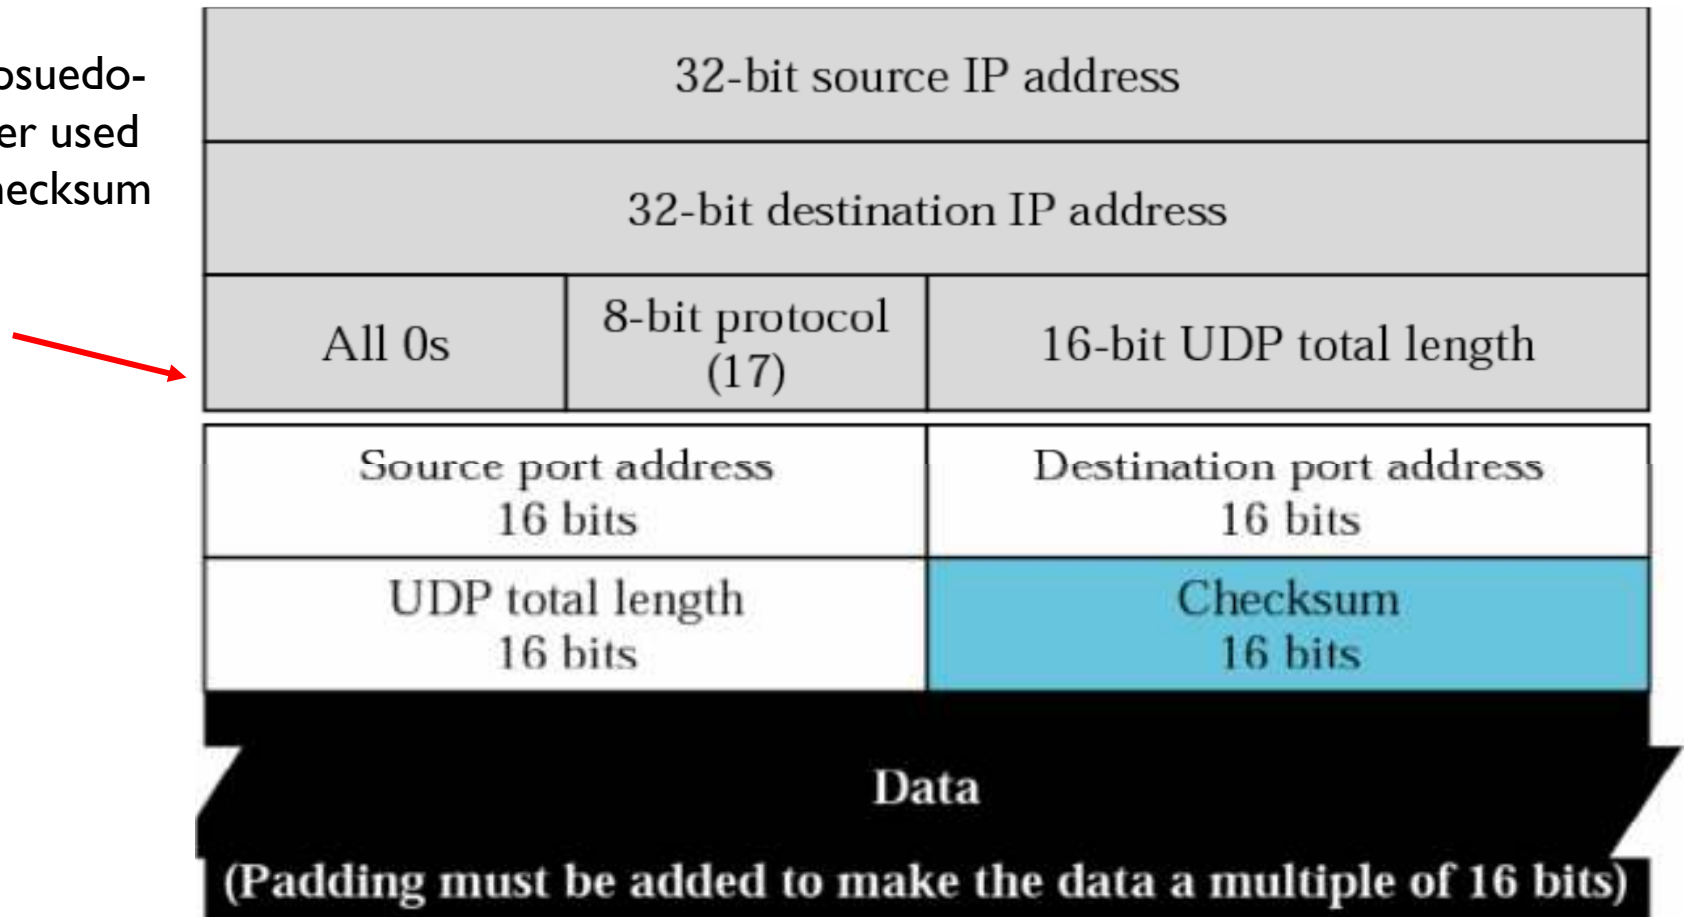

example: add two 16-bit integers

	1	1	1	0	0	1	1	0	0	1	1	0	0	1	1	0
	1	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1
<hr/>																
wraparound	1	1	0	1	1	1	0	1	1	1	0	1	1	1	0	1
<hr/>																
sum	1	0	1	1	1	0	1	1	1	0	1	1	1	1	0	0
checksum	0	1	0	0	0	1	0	0	0	1	0	0	0	0	1	1

*Note:* when adding numbers, a carryout from the most significant bit needs to be added to the result

## Checksum calculation example:

IPv4 psuedo-header used for checksum

## Checksum calculation example:

153.18.8.105			
171.2.14.10			
All 0s	17	15	
1087		13	
15		All 0s	
T	E	S	T
I	N	G	All 0s

## Checksum calculation example:

10011001	00010010	—————>	153.18
00001000	01101001	—————>	8.105
10101011	00000010	—————>	171.2
00001110	00001010	—————>	14.10
00000000	00010001	—————>	0 and 17
00000000	00001111	—————>	15
00000100	00111111	—————>	1087
00000000	00001101	—————>	13
00000000	00001111	—————>	15
00000000	00000000	—————>	0 (checksum)
01010100	01000101	—————>	T and E
01010011	01010100	—————>	S and T
01001001	01001110	—————>	I and N
01000111	00000000	—————>	G and 0 (padding)
<hr/>			
<b>10010110</b>	<b>11101011</b>	—————>	Sum
<b>01101001</b>	<b>00010100</b>	—————>	Checksum

# Lesson 8: Summary

- ❖ Overview of transport layer services
  - An application can choose reliable or unreliable
  - Guarantee of in-order arrival or not
  - How about bandwidth or delivery time guarantee?
- ❖ multiplexing, demultiplexing - addresses and ports
- ❖ UDP - review and investigate the simplest transport protocol

## Lesson 8: UDP Wireshark Lab

- ❖ Complete wireshark lab assignment by answering the questions. Submit to moodle. You do not need to submit screenshots.
- ❖ Submit your answers to the following questions in our textbook at the end of Chapter 3.
  - R7,R8, P3 & P5
