<u>CS450 - Lesson 5: Application layer</u> <u>- FTP and Email</u>

Our goals:

- Understand the FTP protocol
 - ❖ FTP stateful, control and data on separate connections
- Understand key Email application concepts and protocols:
 - Multiple options for application development
 - SMTP
 - POP3
 - IMAP
 - Web-based email

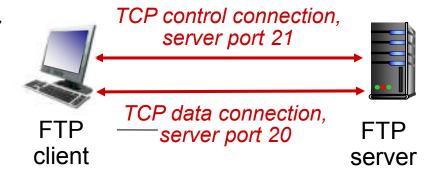

FTP: the file transfer protocol

- transfer file to/from remote host
- client/server model
 - client: side that initiates transfer (either to/from remote)
 - server: remote host
- ftp: RFC 959
- ftp server: port 21

FTP: separate control, data connections

- FTP client contacts FTP server at port 21, using TCP
- client authorized over control connection
- client browses remote directory, sends commands over control connection
- when server receives file transfer command, server opens 2nd TCP data connection (for file) to client
- after transferring one file, server closes data connection

- server opens another TCP data connection to transfer another file
- control connection: "out of band"
- FTP server maintains
 "state": current directory,
 earlier authentication

FTP commands, responses

sample commands:

- sent as ASCII text over control channel
- USER username
- * PASS password
- LIST return list of file in current directory
- RETR filename retrieves (gets) file
- STOR filename stores (puts) file onto remote host

sample return codes

- status code and phrase (as in HTTP)
- * 331 Username OK, password required
- 125 data
 connection
 already open;
 transfer starting
- * 425 Can't open data connection
- 452 Error writing
 file

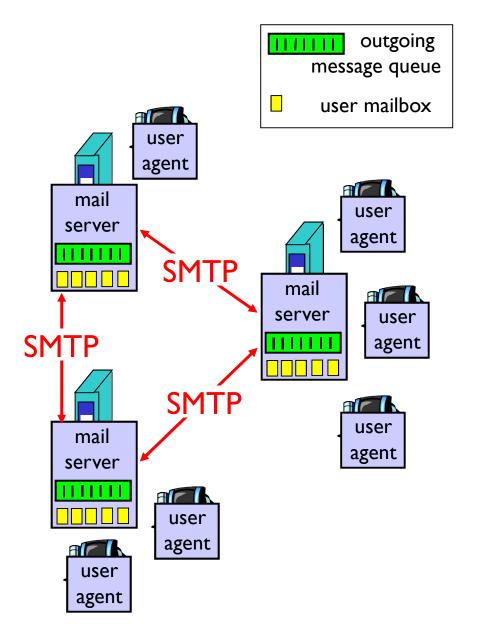

Electronic Mail

Three major components:

- user agents
- mail servers
- simple mail transfer protocol: SMTP

User Agent

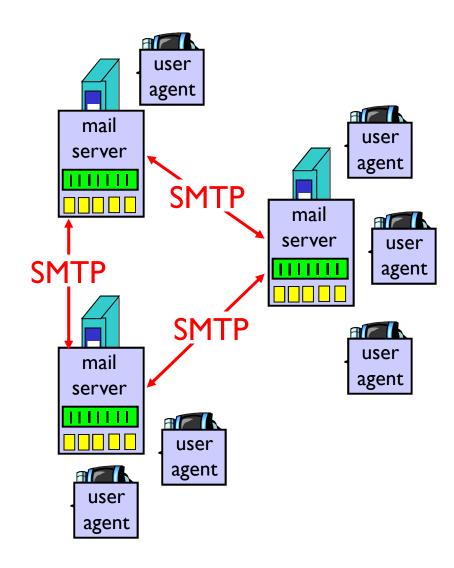

- a.k.a. "mail reader"
- composing, editing, reading mail messages
- e.g., Outlook, Thunderbird,iPhone mail client
- outgoing, incoming messages stored on server

Electronic Mail: mail servers

Mail Servers

- mailbox contains incoming messages for user
- message queue of outgoing (to be sent) mail messages
- SMTP protocol between mail servers to send email messages
 - client: sending mail server
 - "server": receiving mail server

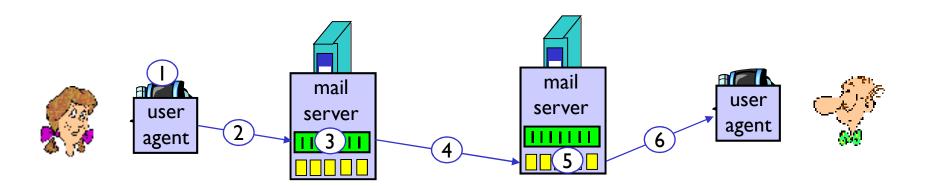

Electronic Mail: SMTP [RFC 2821]

- uses TCP to reliably transfer email message from client to server, port 25
- direct transfer: sending server to receiving server
- three phases of transfer
 - handshaking (greeting)
 - transfer of messages
 - closure
- command/response interaction
 - commands: ASCII text
 - response: status code and phrase
- messages must be in 7-bit ASCII

Scenario: Alice sends message to Bob

- I) Alice uses UA to compose message and "to" bob@someschool.edu
- 2) Alice's UA sends message to her mail server; message placed in message queue
- 3) Client side of SMTP opens TCP connection with Bob's mail server

- 4) SMTP client sends Alice's message over the TCP connection
- 5) Bob's mail server places the message in Bob's mailbox
- 6) Bob invokes his user agent to read message

Sample SMTP interaction

```
S: 220 hamburger.edu
C: HELO crepes.fr
S: 250 Hello crepes.fr, pleased to meet you
C: MAIL FROM: <alice@crepes.fr>
S: 250 alice@crepes.fr... Sender ok
C: RCPT TO: <bob@hamburger.edu>
S: 250 bob@hamburger.edu ... Recipient ok
C: DATA
S: 354 Enter mail, end with "." on a line by itself
C: Do you like ketchup?
C: How about pickles?
C: .
S: 250 Message accepted for delivery
C: OUIT
S: 221 hamburger.edu closing connection
```

Try SMTP interaction for yourself:

- telnet smtp.mum.edu 25
- see 220 reply from server
- enter HELO, MAIL FROM, RCPT TO, DATA, QUIT commands

above lets you send email without using email client (reader)

SMTP: final words

- SMTP uses persistent connections
- SMTP requires message (header & body) to be in 7-bit ASCII
- SMTP server uses CRLF.CRLF to determine end of message

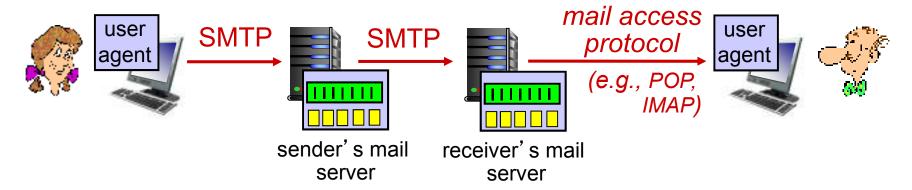

comparison with HTTP:

- HTTP: pull
- SMTP: push
- both have ASCII command/response interaction, status codes
- HTTP: each object encapsulated in its own response msg
- SMTP: multiple objects sent in multipart msg

Mail message format

SMTP: protocol for exchanging email msgs header blank RFC 822: standard for text line message format: header lines, e.g., To: body From: Subject: different from SMTP MAIL FROM, RCPT TO: commands! body the "message", ASCII characters only

Mail access protocols

- * SMTP: delivery/storage to receiver's server
- mail access protocol: retrieval from server
 - POP: Post Office Protocol [RFC 1939]: authorization, download
 - IMAP: Internet Mail Access Protocol [RFC 1730]: more features, including manipulation of stored msgs on server
 - HTTP: gmail, Hotmail, Yahoo! Mail, etc.

POP3 protocol

authorization phase

- client commands:
 - user: declare username
 - pass: password
- server responses
 - +OK
 - -ERR

transaction phase, client:

- list: list message numbers
- retr: retrieve message by number
- dele: delete
- quit

```
S: +OK POP3 server ready
C: user bob
S: +OK
C: pass hungry
S: +OK user successfully logged on
C: list
S: 1 498
S: 2 912
C: retr 1
S: <message 1 contents>
S:
C: dele 1
C: retr 2
S: <message 1 contents>
S:
C: dele 2
C: quit
```

S: +OK POP3 server signing off

POP3 (more) and IMAP

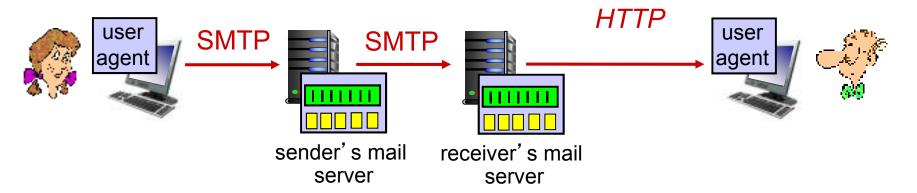

more about POP3

- previous example uses "download and delete" mode.
- Bob cannot re-read e-mail
 if he changes client
- "download-and-keep": copies of messages on different clients
- POP3 is stateless across sessions

IMAP

- keeps all messages in one place: at server
- allows user to organize messages in folders
- keeps user state across sessions:
 - names of folders and mappings between message IDs and folder name

Mail access protocols

- SMTP: communication between server
- HTTP: between servers and browsers
 - A \$400M idea for Hotmail creators in 1997
 - first-mover advantage
 - Viral marketing

Lesson 5: Summary

The evolution of email is an excellent example of the power of a layered architecture that allows applications to move from simple to more powerful.

FTP – a application layer protocol that contrasts with HTTP:

- Stateful
- Control and Data on separate connections
